1 GENERAL DESCRIPTION

The ST7789V is a single-chip controller/driver for 262K-color, graphic type TFT-LCD. It consists of 720 source line and 320 gate line driving circuits. This chip is capable of connecting directly to an external microprocessor, and accepts, 8-bits/9-bits/16-bits/18-bits parallel interface. Display data can be stored in the on-chip display data RAM of 240x320x18 bits. It can perform display data RAM read/write operation with no external operation clock to minimize power consumption. In addition, because of the integrated power supply circuit necessary to drive liquid crystal; it is possible to make a display system with the fewest components.

Preliminary

2 FEATURES

- Single chip TFT-LCD Controller/Driver with On-chip Frame Memory (FM)
- Display Resolution: 240*RGB (H) *320(V)
- Frame Memory Size: 240 x 320 x 18-bit = 1,382,400 bits
- LCD Driver Output Circuits
 - Source Outputs: 240 RGB Channels
 - Gate Outputs: 320 Channels
 - Common Electrode Output
- Display Colors (Color Mode)
 - Full Color: 262K, RGB=(666) max., Idle Mode Off
 - Color Reduce: 8-color, RGB=(111), Idle Mode On
- Programmable Pixel Color Format (Color Depth) for Various Display Data input Format
 - 12-bit/pixel: RGB=(444)
 - 16-bit/pixel: RGB=(565)
 - 18-bit/pixel: RGB=(666)
- MCU Interface
 - Parallel 8080-series MCU Interface (8-bit, 9-bit, 16-bit & 18-bit)
 - 6/16/18 RGB Interface(VSYNC, HSYNC, DOTCLK, ENABLE, DB[17:0])
 - Serial Peripheral Interface(SPI Interface)
 - VSYNC Interface
- Display Features
 - Programmable Partial Display Duty
 - CABC for saving current consumption
 - Color enhancement
- On Chip Build-In Circuits
 - DC/DC Converter
 - Adjustable VCOM Generation
 - Non-Volatile (NV) Memory to Store Initial Register Setting and Factory Default Value (Module ID, Module Version, etc)
 - Timing Controller
 - 4 preset Gamma curve with separated RGB Gamma setting
- Build-In NV Memory for LCD Initial Register Setting
 - 8-bits for ID1 setting
 - 8-bits for ID2 setting
 - 8-bits for ID3 setting
 - 6-bits for VCOM Offset adjustment
- Driving Algorithm

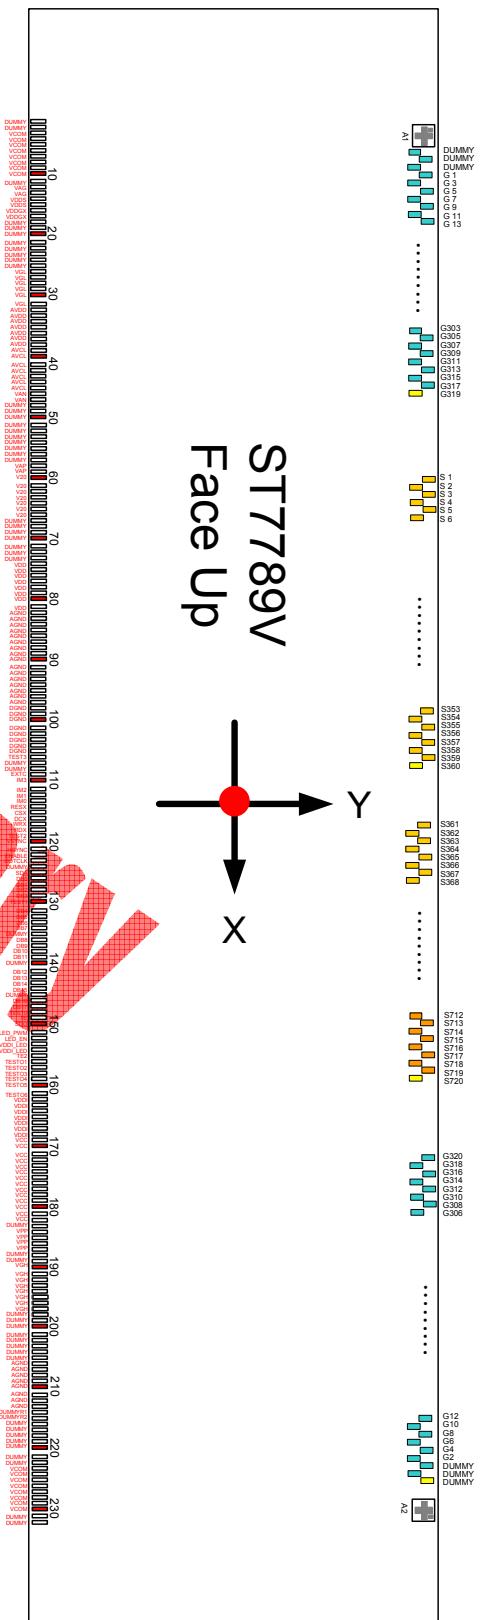

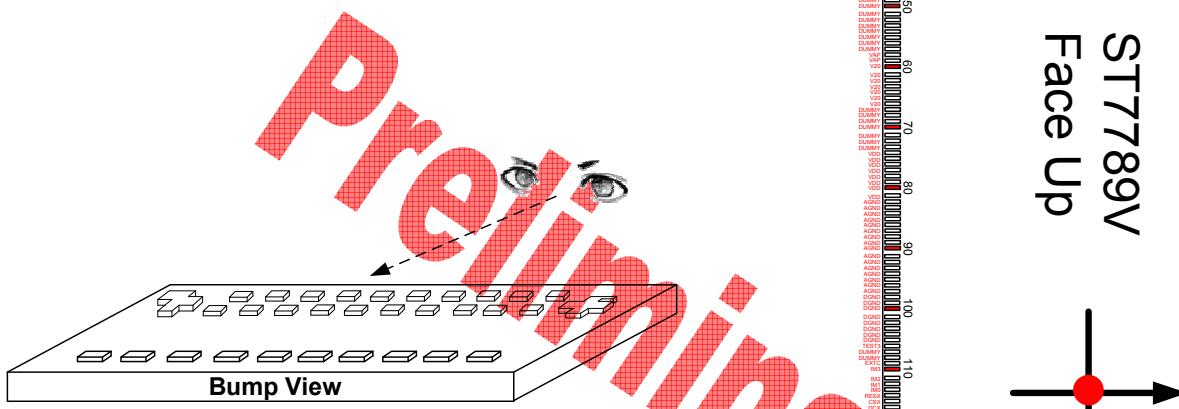

- Dot Inversion
- Column Inversion
- Wide Supply Voltage Range
 - I/O Voltage (VDDI to DGND): 1.65V ~ 3.3V ($VDDI \leq VDD$)
 - Analog Voltage (VDD to AGND): 2.4V ~ 3.3V
- On-Chip Power System
 - Source Voltage (VAP (GVDD) to VAN (GVCL)): +6.4~-4.6V
 - VCOM level: GND
 - Gate driver HIGH level (VGH to AGND): +12.2V ~ +14.97V
 - Gate driver LOW level (VGL to AGND): -12.5V ~ -7.16V
- Optimized layout for COG Assembly
- Operate temperature range: -30°C to $+85^{\circ}\text{C}$
- Lower Power Consumption

6 PIN DESCRIPTION

6.1 Power Supply Pins

| Name | I/O | Description | Connect Pin |
|----------|-----|--|-------------|
| VDD | I | Power Supply for Analog, Digital System and Booster Circuit. | VDD |
| VDDI | I | Power Supply for I/O System. | VDDI |
| VDDI_LED | I | Power Supply for LED driver. If not used, please fix this pad to GND level. | - |
| AGND | I | System Ground for Analog System and Booster Circuit. | GND |
| DGND | I | System Ground for I/O System and Digital System. | GND |

| EXTC | I | -Select to access extension command ("Low": system command 1, "High": system command 1 and 2). -When programming NVM, this pin should connect to high level. | | | | | | DGND/VDDI |
| VPP | I | -When programming NVM, it needs external power supply voltage (7.5V); the current of Vpp must be more than 10mA. -If not used, let this pin open. | | | | | | - |
| RESX | I | -This signal will reset the device and it must be applied to properly initialize the chip. -Signal is active low. | | | | | | MCU |
| CSX | I | -Chip selection pin Low enable. High disable. | | | | | | MCU |
| DCX | I | -Display data/command selection pin in parallel interface. -This pin is used to be serial interface clock. | | | | | | MCU |

| Name | I/O | Description | Connect Pin |
|----------|-----|---|-------------|
| | | DCX='1': display data or parameter. DCX='0': command data. -If not used, please fix this pin at VDDI or DGND. | |
| RDX | I | -Read enable in 8080 MCU parallel interface. -If not used, please fix this pin at VDDI or DGND. | MCU |
| WRX | I | -Write enable in MCU parallel interface. - Display data/command selection pin in 4-line serial interface. - Second Data lane in 2 data lane serial interface. -If not used, please fix this pin at VDDI or DGND. | MCU |
| VSYNC | I | -Vertical (Frame) synchronizing input signal for RGB interface operation. -If not used, please fix to the VDDI or DGND. | MCU |
| H SYNC | I | -Horizontal (Line) synchronizing input signal for RGB interface operation. - If not used, please fix to VDDI or DGND. | MCU |
| ENABLE | I | -Data enable signal for RGB interface operation. -If not used, please fix this pin at VDDI or DGND. | MCU |
| DOTCLK | I | -Dot clock signal for RGB interface operation. -If not used, please fix this pin at VDDI or DGND. | MCU |
| SDA | I/O | -When IM3: Low, SPI interface input/output pin. -When IM3: High, SPI interface input pin. -The data is latched on the rising edge of the SCL signal. -If not used, please fix this pin at VDDI or DGND level. | MCU |
| SDO | O | -SPI interface output pin. -The data is output on the falling edge of the SCL signal. -If not used, let this pin open. | MCU |
| DB[17:0] | I/O | -DB[17:0] are used as MCU parallel interface data bus. 8-bit I/F: when IM3:0, DB[7:0] are used; when IM3:1, DB[17:10] are used. 9-bit I/F: when IM3:0, DB[8:0] are used; when IM3:1, DB[17:9] are used. 16-bit I/F: when IM3:0, DB[15:0] are used; when IM3:1, DB[17:10] and DB[8:1] are used. 18-bit I/F: DB[17:0] are used. -DB[17:0] are used as RGB interface data bus. 6-bit RGB I/F: DB[5:0] are used. 16-bit RGB I/F: DB[17:13], DB[11:1] are used. 18-bit RGB I/F: DB[17:0] are used. -If not used, please fix this pin at VDDI or DGND. | MCU |
| TE | O | -Tearing effect signal is used to synchronize MCU to frame memory | MCU |

| | | writing. -If not used, please let this pin open | |

Note1. "1" = VDDI level, "0" = DGND level.

Note2. When in parallel mode, unused data pins must be connected to "1" or "0".

Note3. When CSX="1", there is no influence to the parallel and serial interface.

6.3 Driver Output Pins

| Name | I/O | Description | Connect pin |
|------------|-----|--|------------------|
| S1 to S720 | O | -Source driver output pad. | LCD |
| G1 to G320 | O | -Gate driver output pad. VGH: Selecting Gate Lines Level. VGL: Non-selecting Gate Lines Level. | LCD |
| AVDD | O | -Power pad for analog circuit. | OPEN |
| VAP(GVDD) | O | - A power output of grayscale voltage generator. | OPEN |
| AVCL | O | - A power supply pin for generating VAN. | OPEN |
| VAN(GVCL) | O | - A power output (Negative) of grayscale voltage generator. | OPEN |
| VGH | O | - Power output pin for gate driver | OPEN |
| VGL | O | - Power output (Negative) pin for gate driver | OPEN |
| VCC | O | - Monitoring pin of internal digital reference voltage. | OPEN |
| VCOM | O | -A power supply for the TFT-LCD common electrode. | Common Electrode |
| LED_PWM | O | -Output pad for PWM output signal to driving LED. -If not used, keep it open. | - |
| LED_EN | O | -Output pad for enabling LED. -If not used, keep it open. | - |

6.4 Test and other pins

| | | | |
|-----------------------------|---|--|------|
| TEST3~TEST0 | I | Input pins for testing. Please open these pins. | OPEN |
| TE2 | O | Output pin for testing. Please keep this pin floating. | OPEN |
| TEST06~TEST01 | O | Output pins for testing. Please keep these pins floating. | OPEN |
| DUMMY | - | These pins are dummy (no electrical characteristic) Can pass signal through these pads on TFT panel. Please open these pins. | OPEN |
| DUMMYR1 DUMMYR2 | - | These pins are dummy (no electrical characteristic). DUMMYR1 and DUMMYR2 are connected each other internally. | OPEN |
| VAG VDDS VDDGX V20 | O | Used for monitoring Please keep these pins floating. | OPEN |

| Logic Input Voltage Range | VIN | 0.5 ~ VDDI + 0.5 | V |
| Logic Output Voltage Range | VO | 0.5 ~ VDDI + 0.5 | V |
| Operating Temperature Range | TOPR | -30 ~ +85 | °C |
| Storage Temperature Range | TSTG | -40 ~ +125 | °C |

Table 1 Absolute Operation Range

Note: If one of the above items is exceeded its maximum limitation momentarily, the quality of the product may be degraded.

Absolute maximum limitation, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the recommend range.

Notes:

1. TA= -30 to 70°C (to +85°C no damage).
2. Source channel loading= 2KΩ+12pF/channel, Gate channel loading=5KΩ+40pF/channel.
3. The Max. value is between measured point of source output and gamma setting value.
4. When evaluating the maximum and minimum of VGH, VDD=2.8V.

5. The maximum value of $|VGH-VGL|$ can no over 30V.

6. Default register setting of Vcom and Vcomoffset is 20h

Notes:

1. The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from NVM (or similar device) to registers. This loading is done every time when there is HW reset cancel time (t_{RT}) within 5 ms after a rising edge of RESX.
2. Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

| RESX Pulse | Action |
|---------------------|----------------|
| Shorter than 5us | Reset Rejected |
| Longer than 9us | Reset |
| Between 5us and 9us | Reset starts |

3. During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out -mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware Reset.

4. Spike Rejection also applies during a valid reset pulse as shown below:

5. When Reset applied during Sleep In Mode.

6. When Reset applied during Sleep Out Mode.

7. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

8.2 8080- I Series MCU Parallel Interface

The MCU can use one of following interfaces: 11-lines with 8-data parallel interface, 12-lines with 9-data parallel interface, 19-line with 16-data parallel interface or 21-lines with 18-data parallel interface. The chip-select CSX (active low) enables/disables the parallel interface. RESX (active low) is an external reset signal. WRX is the parallel data write enable, RDX is the parallel data read enable and D[17:0] is parallel data bus.

The LCD driver reads the data at the rising edge of WRX signal. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits is either display data or command parameter. When D/C='0', D[17:0] bits is command. The interface functions of 8080-series parallel interface are given in following table.

| | | | | Interface | D/CX | RDX | WRX | Read back selection |
|---|---|---|---|-----------------|------|-----|-----|--|
| 0 | 0 | 0 | 0 | 8-bit parallel | 0 | 1 | ↑ | Write 8-bit command (D7 to D0) |
| | | | | | 1 | 1 | ↑ | Write 8-bit display data or 8-bit parameter (D7 to D0) |

Table 10 the function of 8080-series parallel interface

8.2.1 Write cycle sequence

The write cycle means that the host writes information (command / data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control signals (DCX, RDX, WRX) and data signals (DB[17:0]). DCX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low ('=0') and vice versa it is data ('=1').

Note: WRX is an unsynchronized signal (It can be stopped).

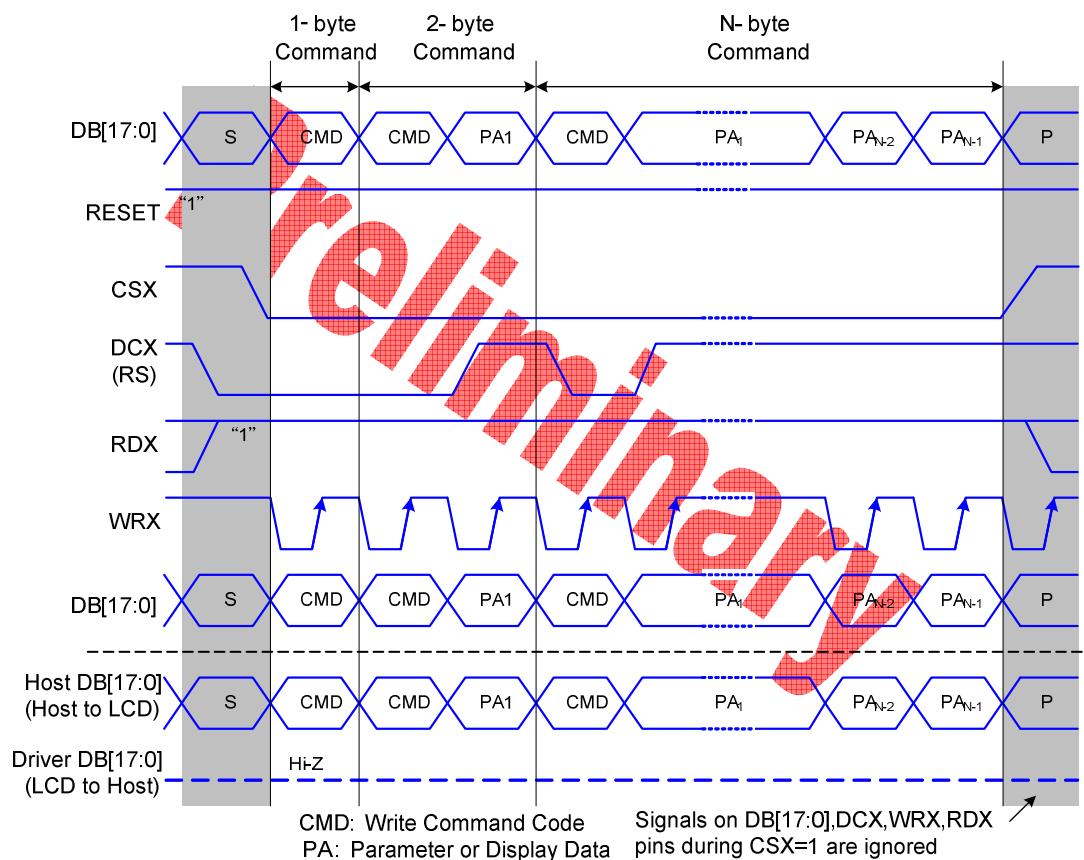

Figure 9 8080-Series Parallel Bus Protocol, Write to Register or Display RAM

8.2.2 Read cycle sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from LCD driver via interface. The driver sends data (D[17:0]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

Note: RDX is an unsynchronized signal (It can be stopped).

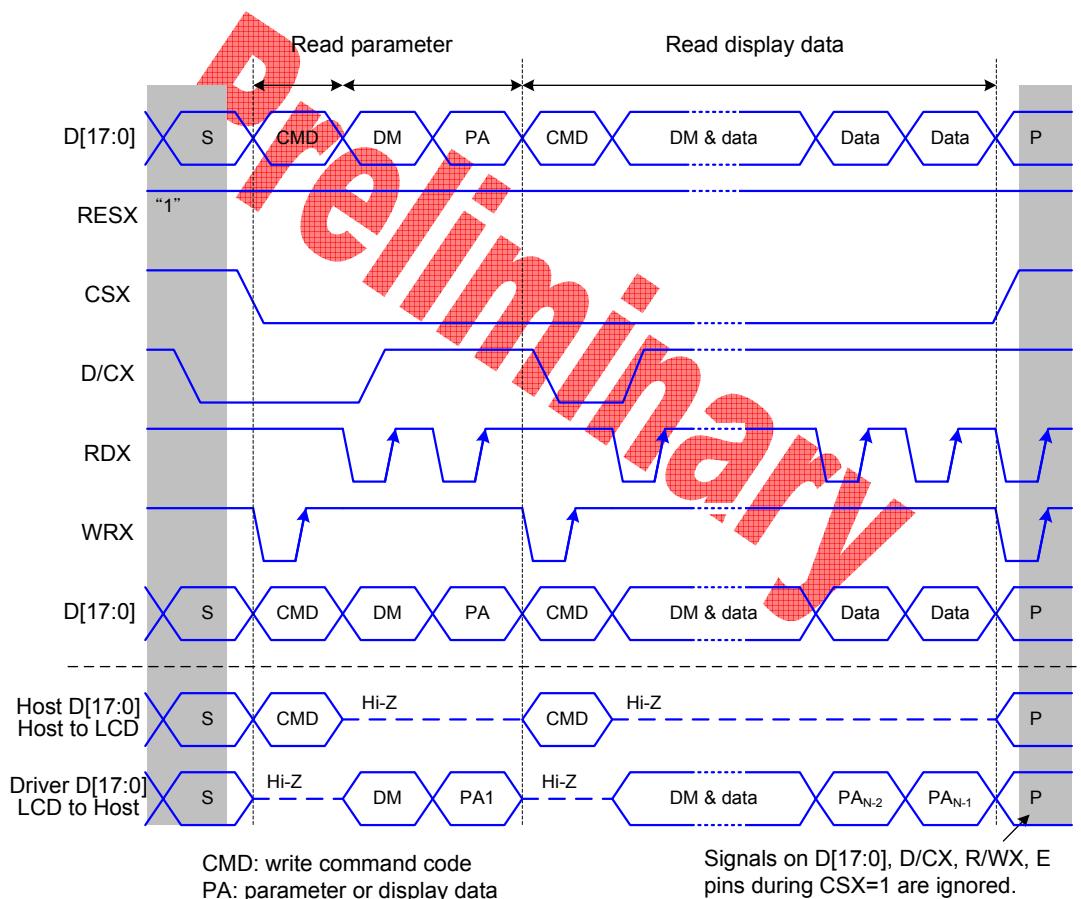

Figure 11 8080-series parallel bus protocol, read data from register or display RAM

8.3 8080-II series MCU Parallel Interface

The MCU uses one of following interface: 11-lines with 8-data parallel interface, 12-lines with 9-data parallel interface, 19-lines with 16-data parallel interface, or 21-lines with 18-data parallel interface. The chip-select CSX(active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. The R/WX is the Read/Write flag and D[17:0] is parallel data bus.

The LCD driver reads the data at the rising edge of WRX signal. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits is either display data or command parameter. When D/C='0', D[17:0] bits is command.

The 8080-II series bi-directional interface can be used for communication between the micro controller and LCD driver. Interface bus width can be selected with IM3, IM2, IM1 and IM0. The interface functions of 8080-II series parallel interface are given in Table 11. The function of 8080-II series parallel interface.

| IM3 | IM2 | IM1 | IM0 | Interface | D/CX | RDX | WRX | Function |

Table 12 Selection of serial interface

The serial interface is either 3-lines/9-bits or 4-lines/8-bits bi-directional interface for communication between the micro controller and the LCD driver. The 3-lines serial interface use: CSX (chip enable), SCL (serial clock) and SDA (serial data input/output), and the 4-lines serial interface use: CSX (chip enable), DCX (data/ command flag), SCL (serial clock) and SDA (serial data input/output). Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

Table 13 pin description of serial interface

8.4.2 Command write mode

The write mode of the interface means the micro controller writes commands and data to the LCD driver. 3-lines serial data packet contains a control bit D/CX and a transmission byte. In 4-lines serial interface, data packet contains just transmission byte and control bit D/CX is transferred by the D/CX pin. If D/CX is “low”, the transmission byte is interpreted as a command byte. If D/CX is “high”, the transmission byte is stored in the display data RAM (memory write command), or command register as parameter.

Any instruction can be sent in any order to the driver. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

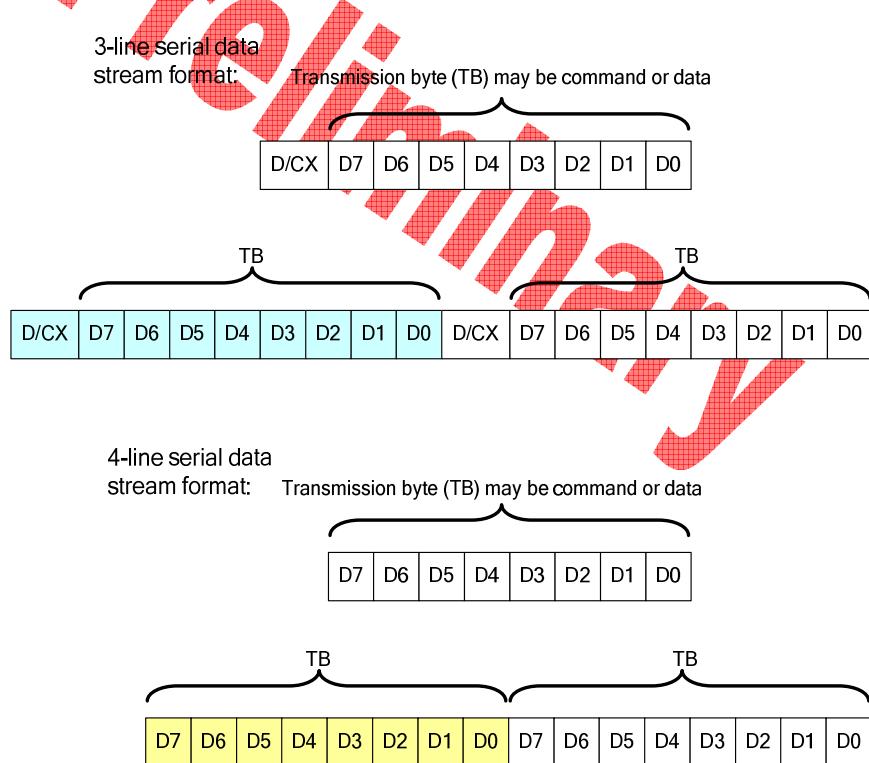

Figure 12 Serial interface data stream format

When CSX is “high”, SCL clock is ignored. During the high period of CSX the serial interface is initialized. At the falling edge of CSX, SCL can be high or low. SDA is sampled at the rising edge of SCL. D/CX indicates whether the byte is command ($D/CX=0$) or parameter/RAM data ($D/CX=1$). D/CX is sampled when first rising edge of SCL (3-line serial interface) or 8th rising edge of SCL (4-line serial interface). If CSX stays low after the last bit of command/data byte, the serial interface expects the D/CX bit (3-line serial interface) or D7

(4-line serial interface) of the next byte at the next rising edge of SCL..

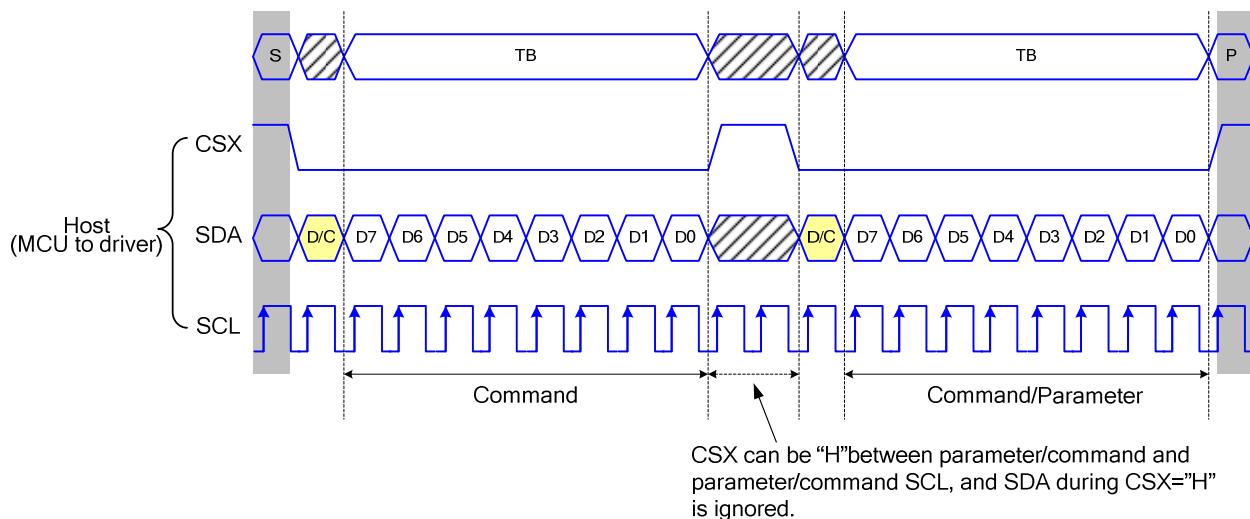

Figure 13 3-line serial interface write protocol (write to register with control bit in transmission)

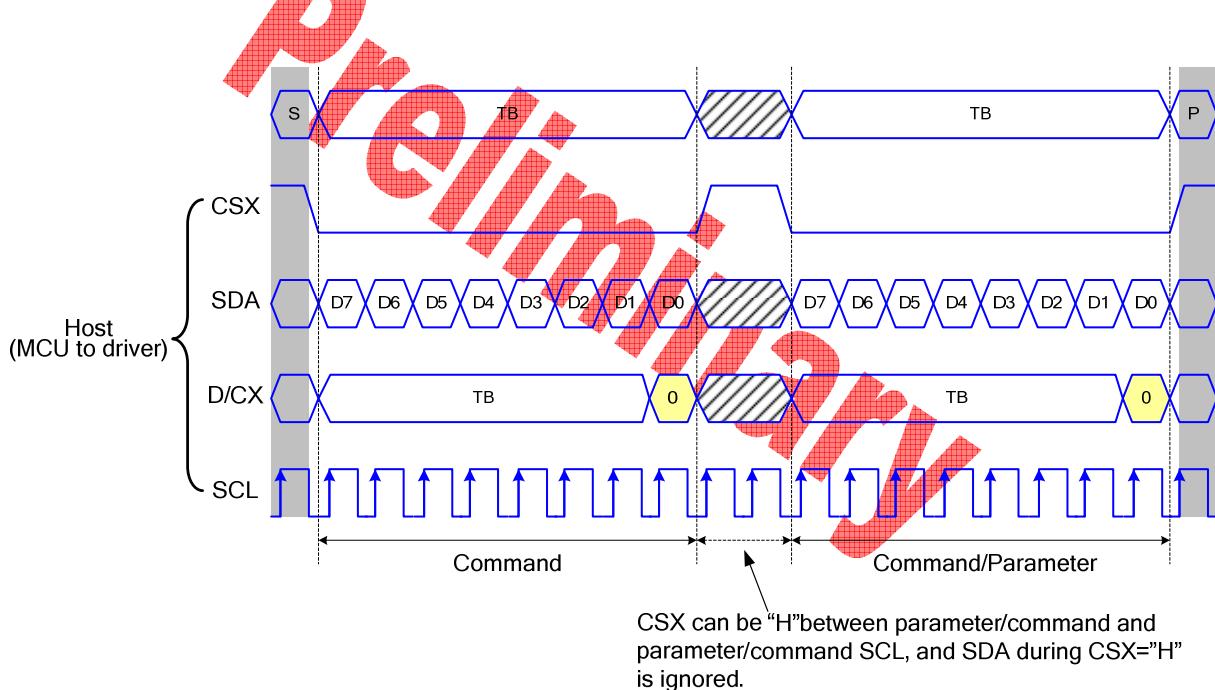

Figure 14 4-line serial interface write protocol (write to register with control bit in transmission)

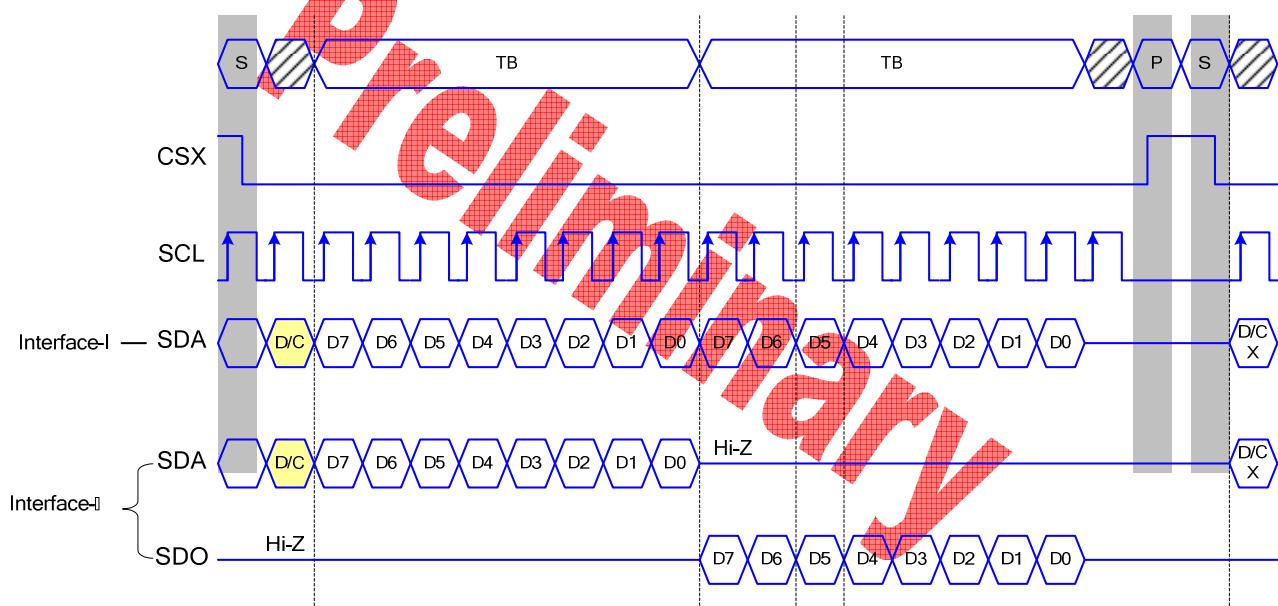

8.4.3 Read function

The **read mode** of the interface means that the micro controller **reads register value from the driver**. To achieve read function, the micro controller first has to **send a command (read ID or register command)** and then the following byte is transmitted in the opposite direction. After that CSX is required to go to high before a new command is send (see the below figure). The driver samples the SDA (input data) at rising edge of SCL, but shifts SDA (output data) at the falling edge of SCL. Thus the micro controller is supported to read at the rising edge of SCL.

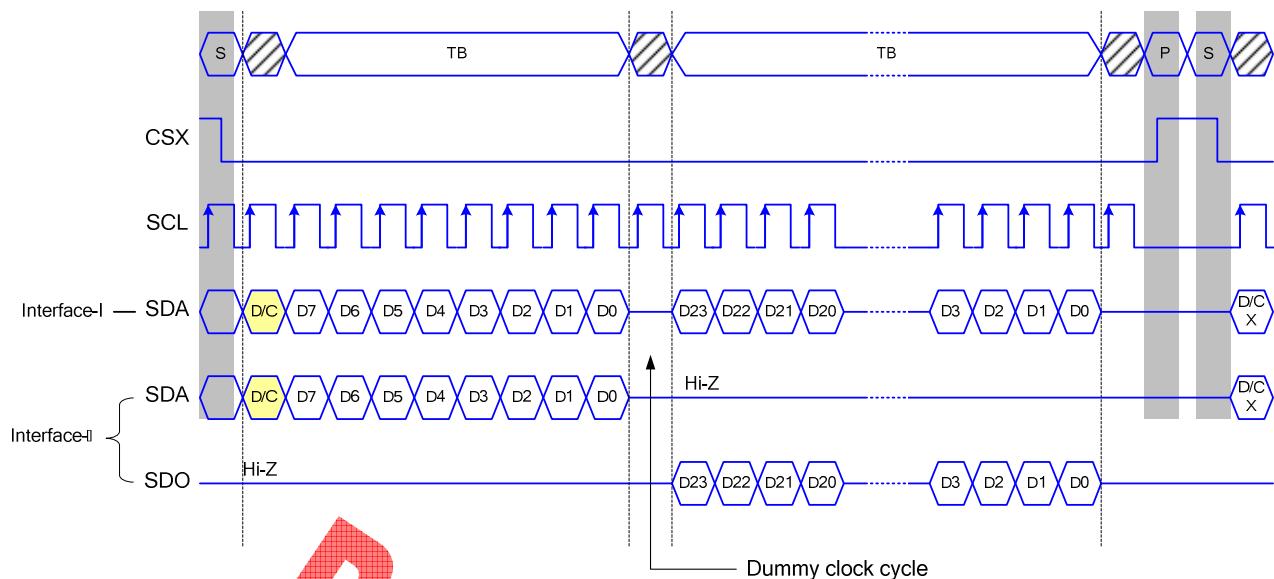

After the read status command has been sent, the SDA line must be set to tri-state no later than at the falling edge of SCL of the last bit.

Command write mode:

The command write protocol of 2-wire data lane serial interface is the same with the 3-line serial interface, so users can ignore the input data of WRX.

Any instruction can be sent in any order to the driver. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

SRAM write mode:

The SRAM write mode of 2-wire data line serial interface need use SDA pin and WRX pin to be data input pins.

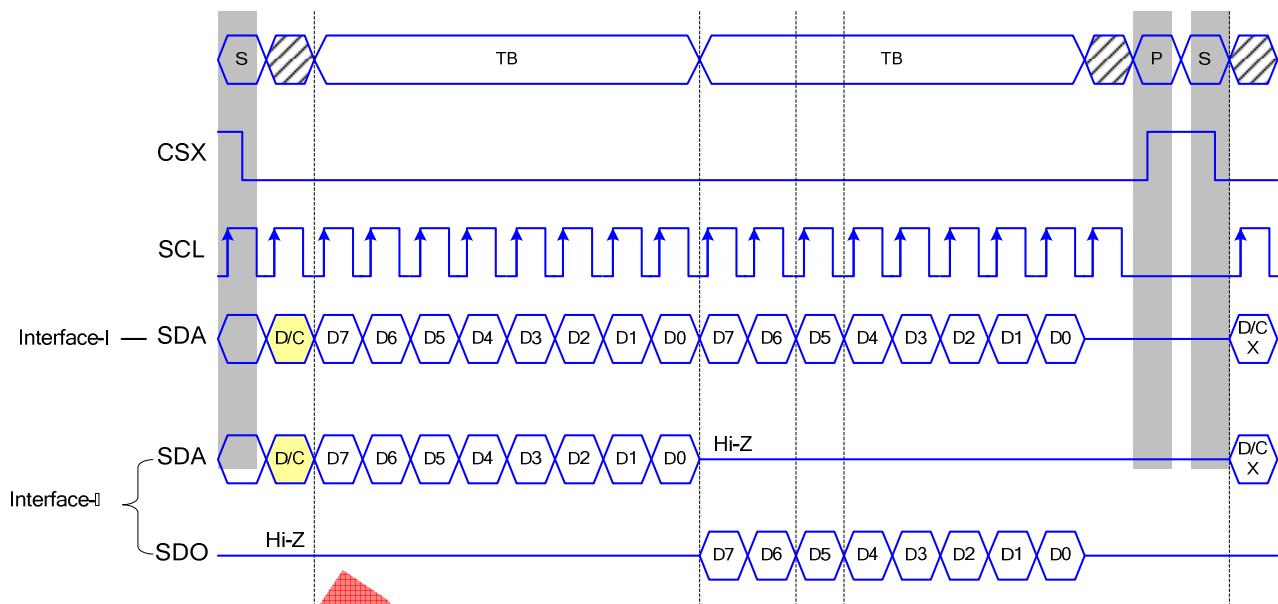

Read function:

The read mode of 2-wire data lane serial interface is the same with the 3-line serial interface and WRX pin can be ignored. To achieve read function, the micro controller first has to send a command (read ID or register command) and then the following byte is transmitted in the opposite direction. After that CSX is required to go to high before a new command is send (see the below figure). The driver samples the SDA (input data) at rising edge of SCL, but shifts SDA (output data) at the falling edge of SCL. Thus the micro controller is supported to read at the rising edge of SCL.

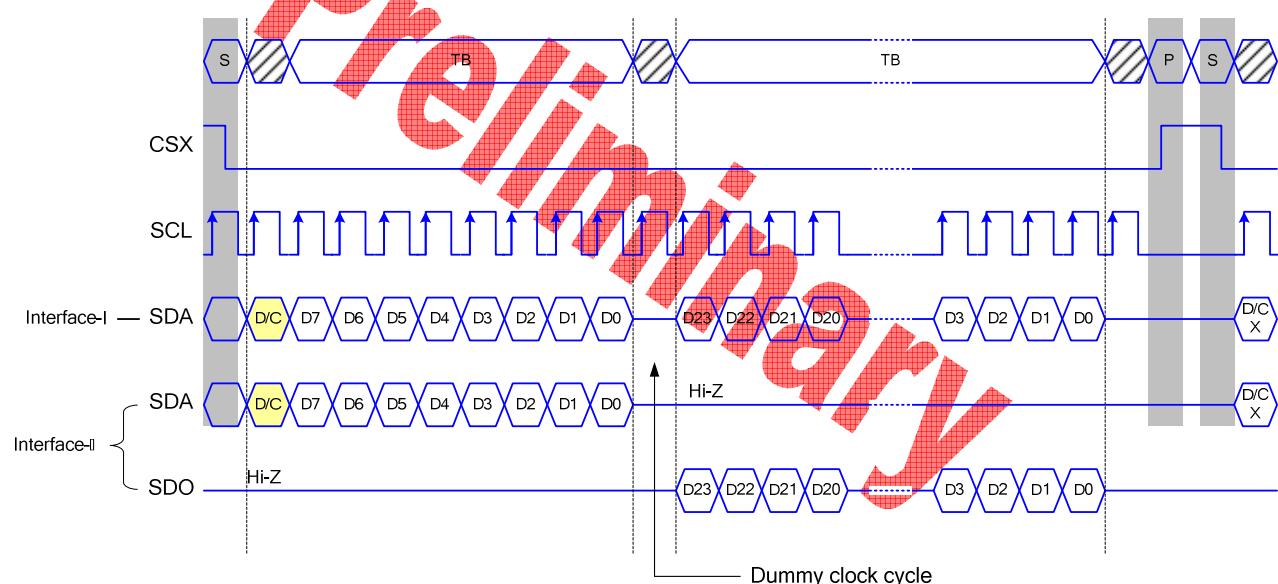

After the read status command has been sent, the SDA line must be set to tri-state no later than at the falling edge of SCL of the last bit.

Preliminary

8.5 Data Transfer Break and Recovery

If there is a break in data transmission by RESX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select line (CSX) is next activated after RESX have been HIGH state.

If there is a break in data transmission by CSX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated.

If 1, 2 or more parameter commands are being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

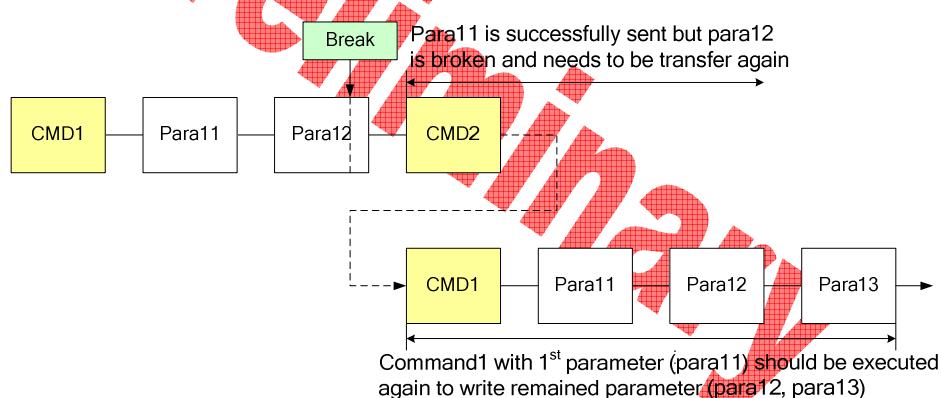

Figure 20 Write interrupts recovery (serial interface)

If a 2 or more parameter commands are being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of that command remains previous value.

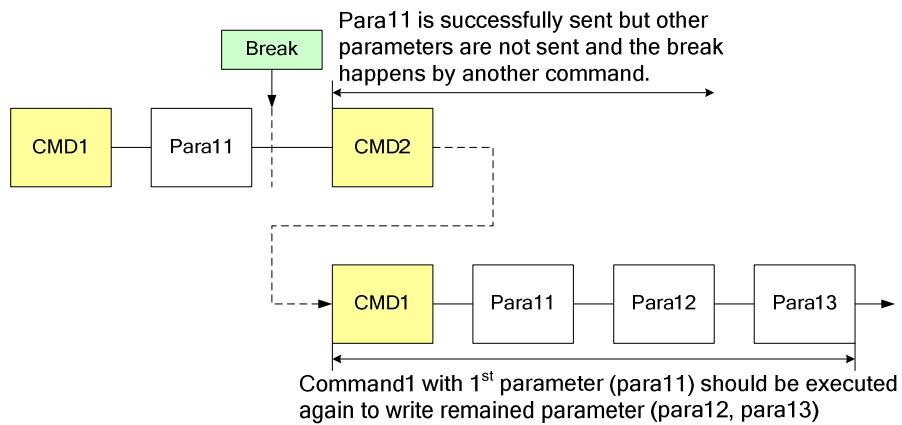

Figure 21 Write interrupts recovery (both serial and parallel Interface)

Preliminary

8.6 Data Transfer Pause

It will be possible when transferring a command, frame memory data or multiple parameter data to invoke a pause in the data transmission. If the chip select line is released after a whole byte of a frame memory data or multiple parameter data has been completed, then driver will wait and continue the frame memory data or parameter data transmission from the point where it was paused. If the chip select Line is released after a whole byte of a command has been completed, then the display module will receive either the command's parameters (if appropriate) or a new command when the chip select line is next enabled as shown below.

This applies to the following 4 conditions:

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

8.6.1 Parallel interface pause

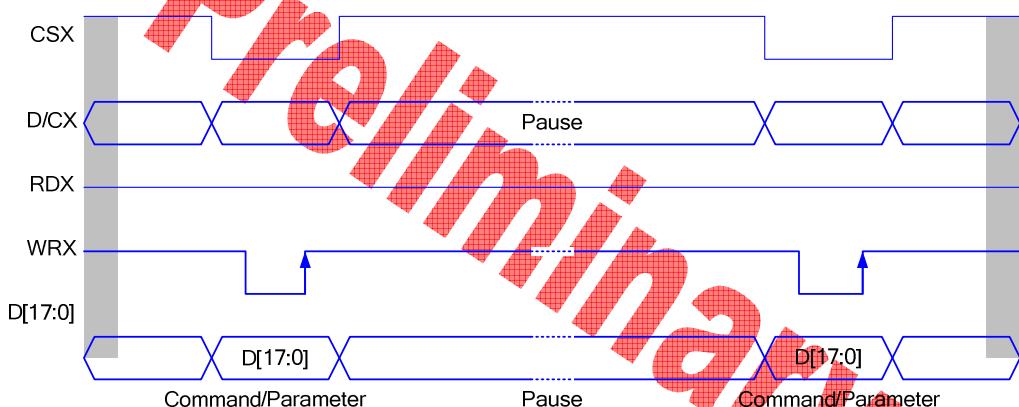

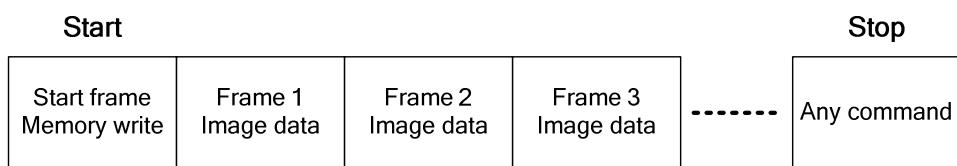

Figure 22 Parallel bus pause protocol (paused by CSX)

8.7 Data Transfer Mode

The module has three kinds color modes for transferring data to the display RAM. These are 12-bit color per pixel, 16-bit color per pixel and 18-bit color per pixel. The data format is described for each interface. Data can be downloaded to the frame memory by 2 methods.

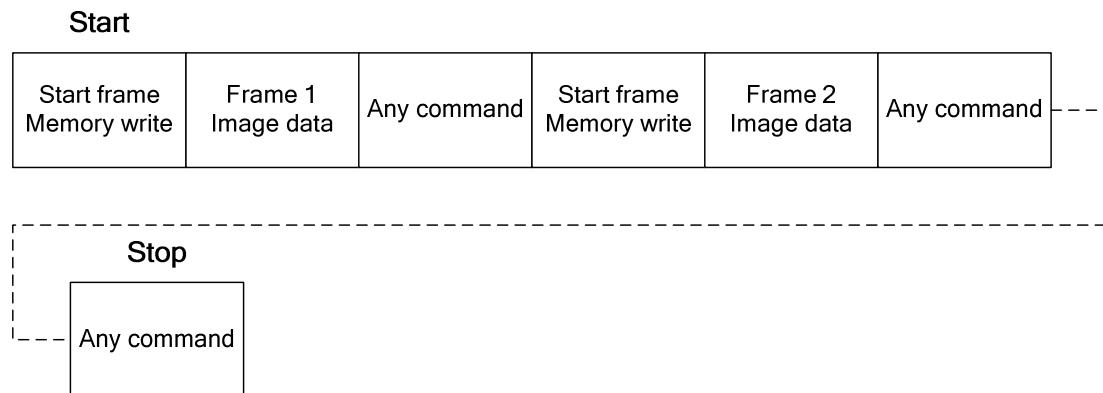

8.7.1 Method 1

The image data is sent to the frame memory in successive frame writes, each time the frame memory is filled, the frame memory pointer is reset to the start point and the next frame is written.

8.7.2 Method 2

The image data is sent and at the end of each frame memory download, a command is sent to stop frame memory write. Then start memory write command is sent, and a new frame is downloaded.

Note 1: These apply to all data transfer Color modes on both serial and parallel interfaces.

Note 2: The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

8.8 Data Color Coding

8.8.1 8080- I series 8-bit Parallel Interface

The 8080- I series 8-bit parallel interface of ST7789V can be used by setting IM[3:0] = "0000b". Different display data formats are available for three Colors depth supported by listed below.

- 4k colors, RGB 4,4,4-bit input.
- 65k colors, RGB 5,6,5-bit input.
- 262k colors, RGB 6,6,6-bit input.

8.8.2 8-bit data bus for 12-bit/pixel (RGB 4-4-4-bit input), 4K-Colors, 3Ah = "03h"

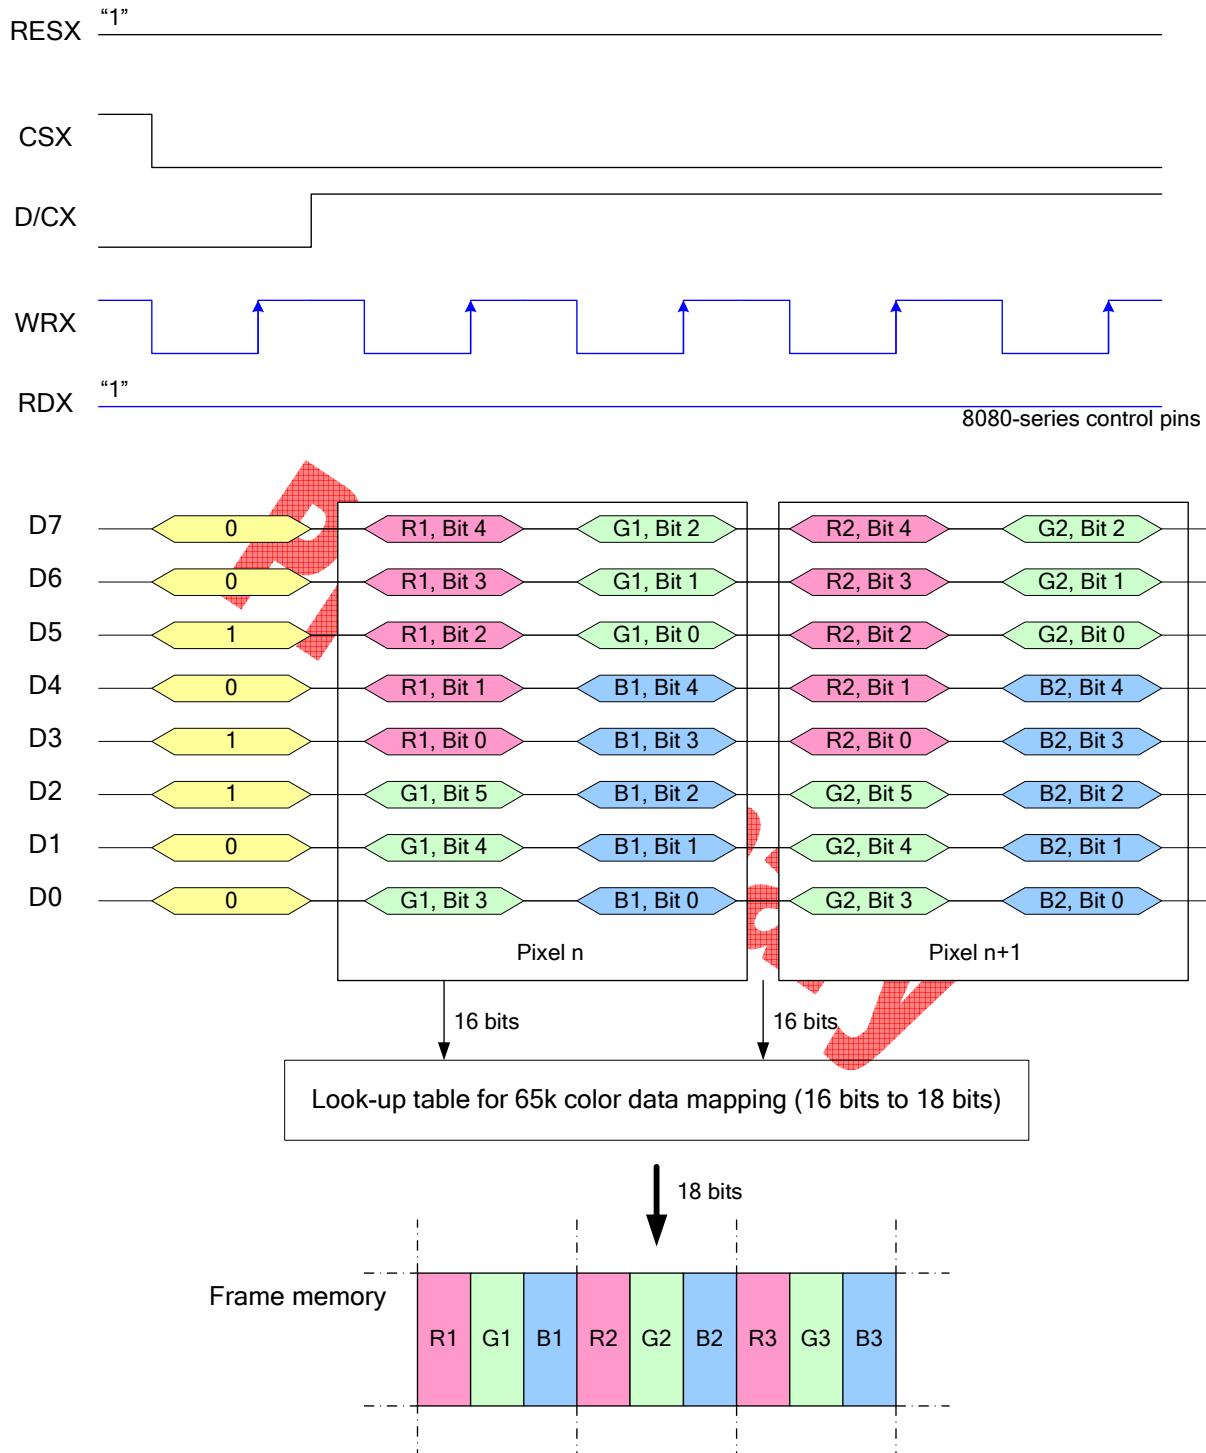

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-time transfer is used to transmit 2 pixel data with the 12-bit color depth information.

Note 3: '-' = Don't care – Can be set to '0' or '1'

8.8.3 8-bit data bus for 16-bit/pixel (RGB 5-6-5-bit input), 65K-Colors, 3Ah="05h"

There is 1pixel (3 sub-pixels) per 2-byte

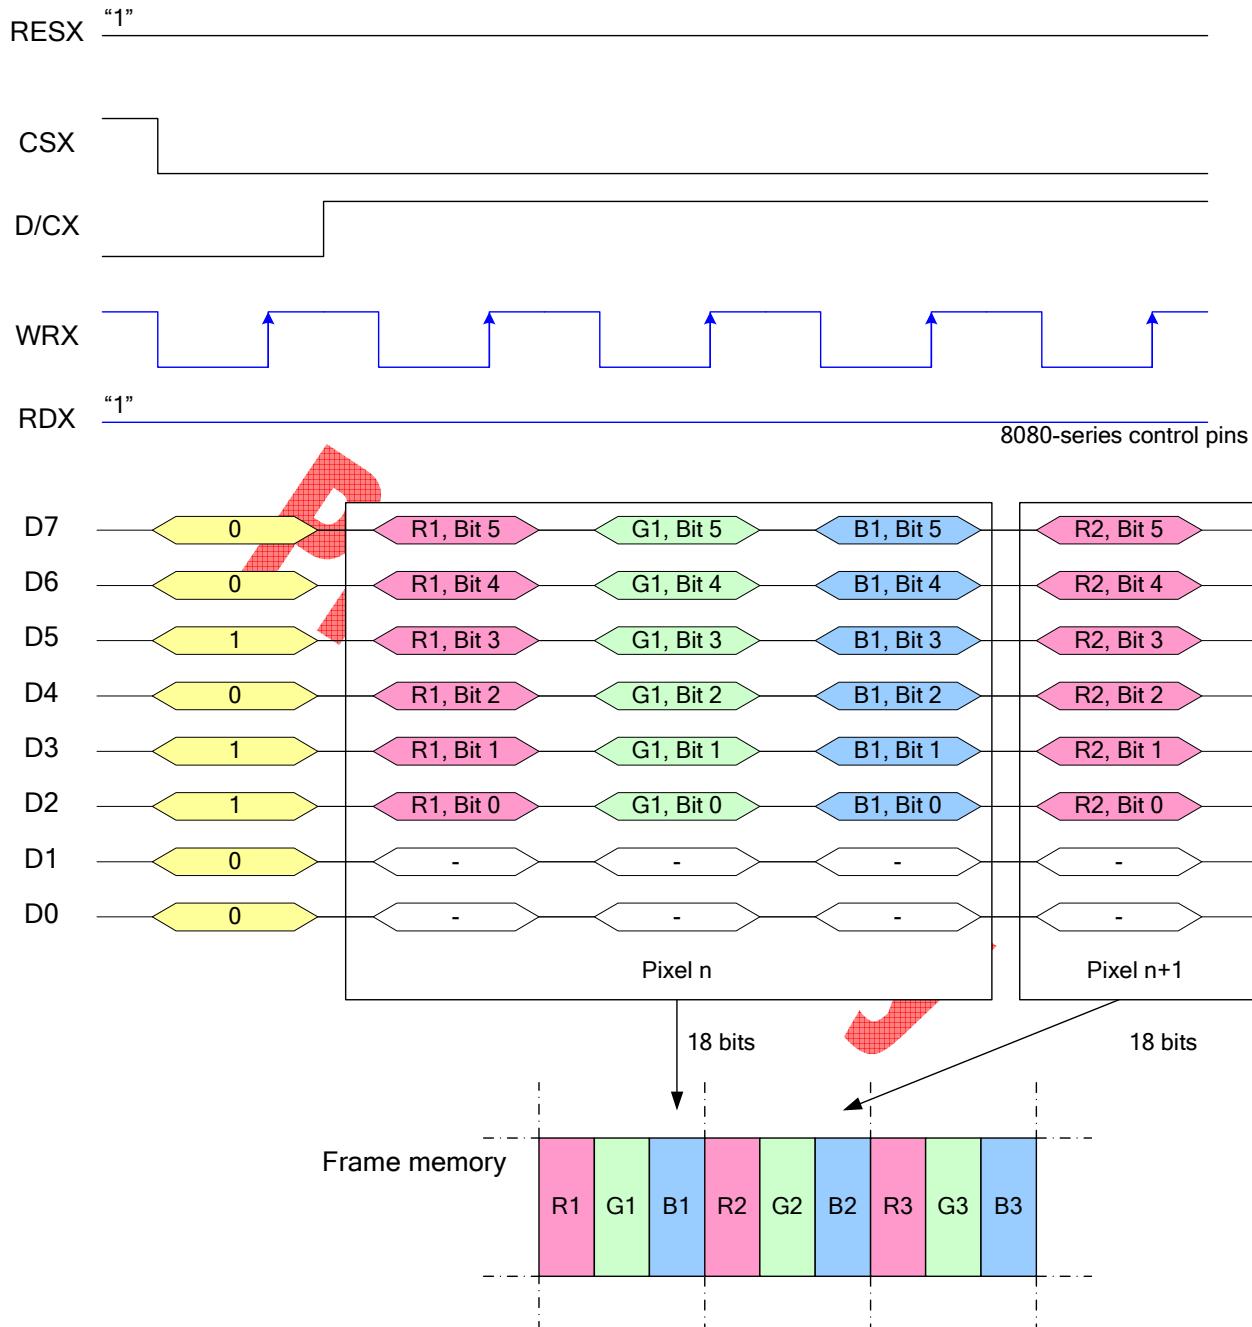

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2: 2-times transfer is used to transmit 1 pixel data with the 16-bit color depth information.

Note 3: '=' = Don't care – Can be set to '0' or '1'

8.8.4 8-bit data bus for 18-bit/pixel (RGB-6-6-6-bit input), 262K-Colors, 3Ah="06h"

There is 1pixel (3 sub-pixels) per 3-bytes.

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

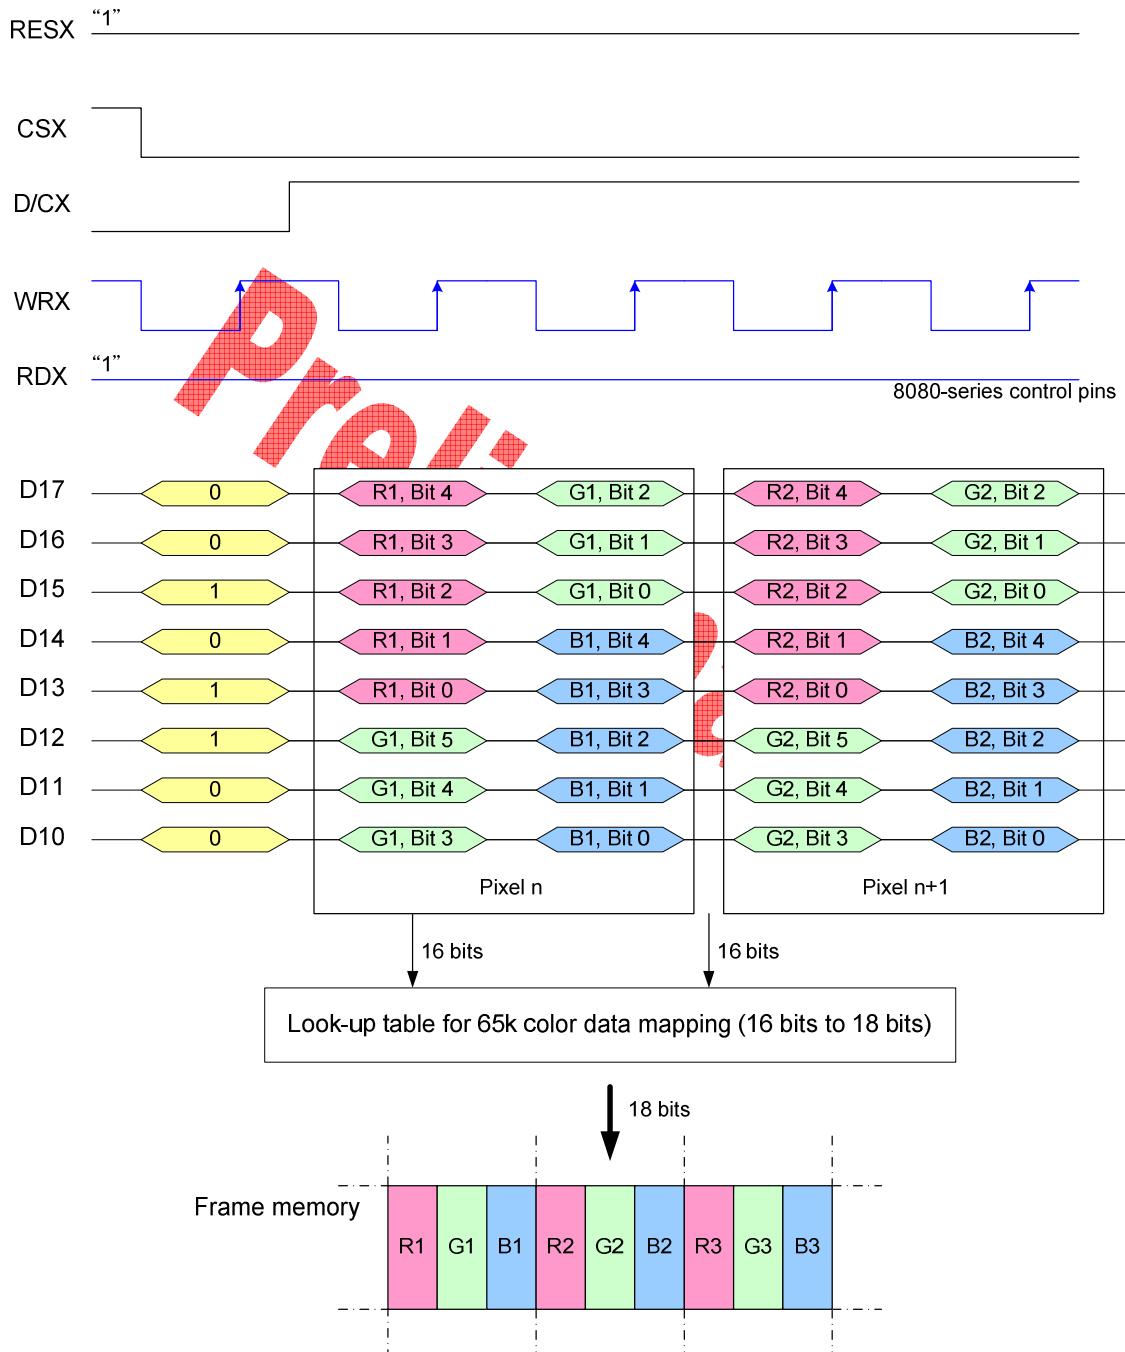

Note 3: '-' = Don't care – Can be set to '0' or '1'

8.8.5 8080-II series 8-bit Parallel Interface

The 8080-II series 8-bit parallel interface of ST7789V can be used by setting IM[3:0] = "1001b". Different display data formats are available for three Colors depth supported by listed below.

- 65k colors, RGB 5,6,5-bit input.
- 262k colors, RGB 6,6,6-bit input.

8.8.6 8-bit data bus for 16-bit/pixel (RGB 5-6-5-bit input), 65K-Colors, 3Ah = "05h"

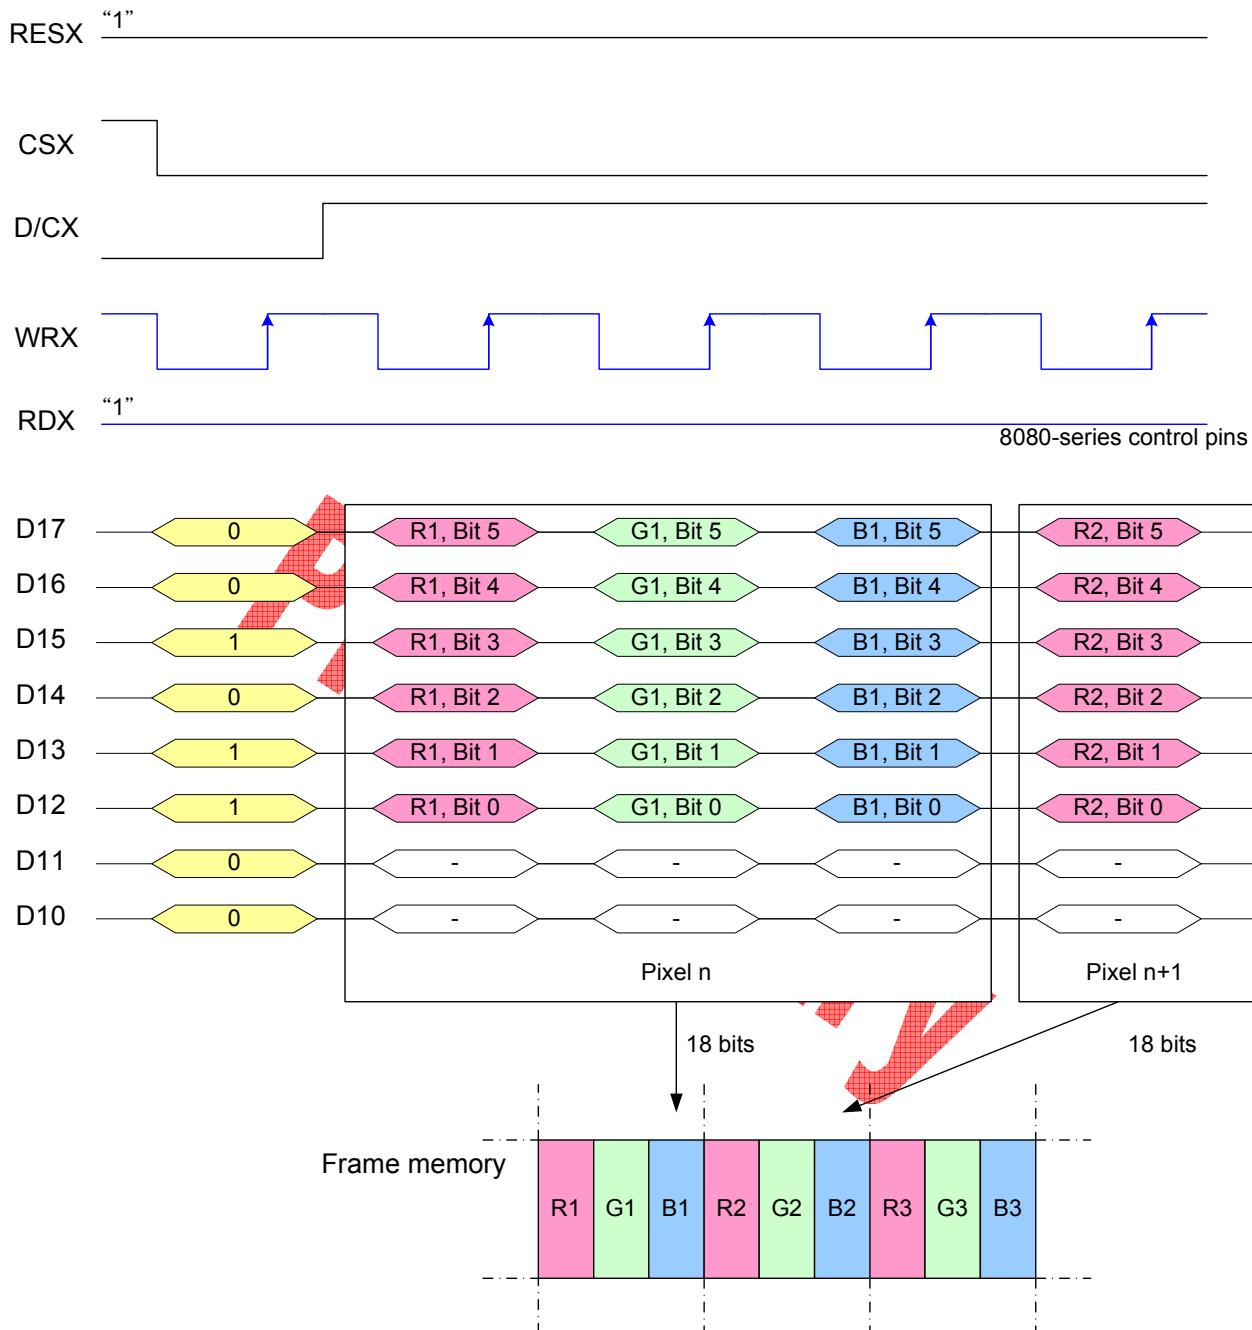

Note 1: The data order is as follows, MSB=D17, LSB=D10 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2: 2-times transfer transmit 1 pixel data with the 16-bit color depth information.

Note 3: '-' = Don't care – Can be set to '0' or '1'

8.8.7 8-bit data bus for 18-bit/pixel (RGB 6-6-6-bit input), 262K-Colors, 3Ah="06h"

Note 1: The data order is as follows, MSB=D17, LSB=D10 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

Note 3: '-' = Don't care – Can be set to '0' or '1'

8.8.8 8080- I series 16-Bit Parallel Interface

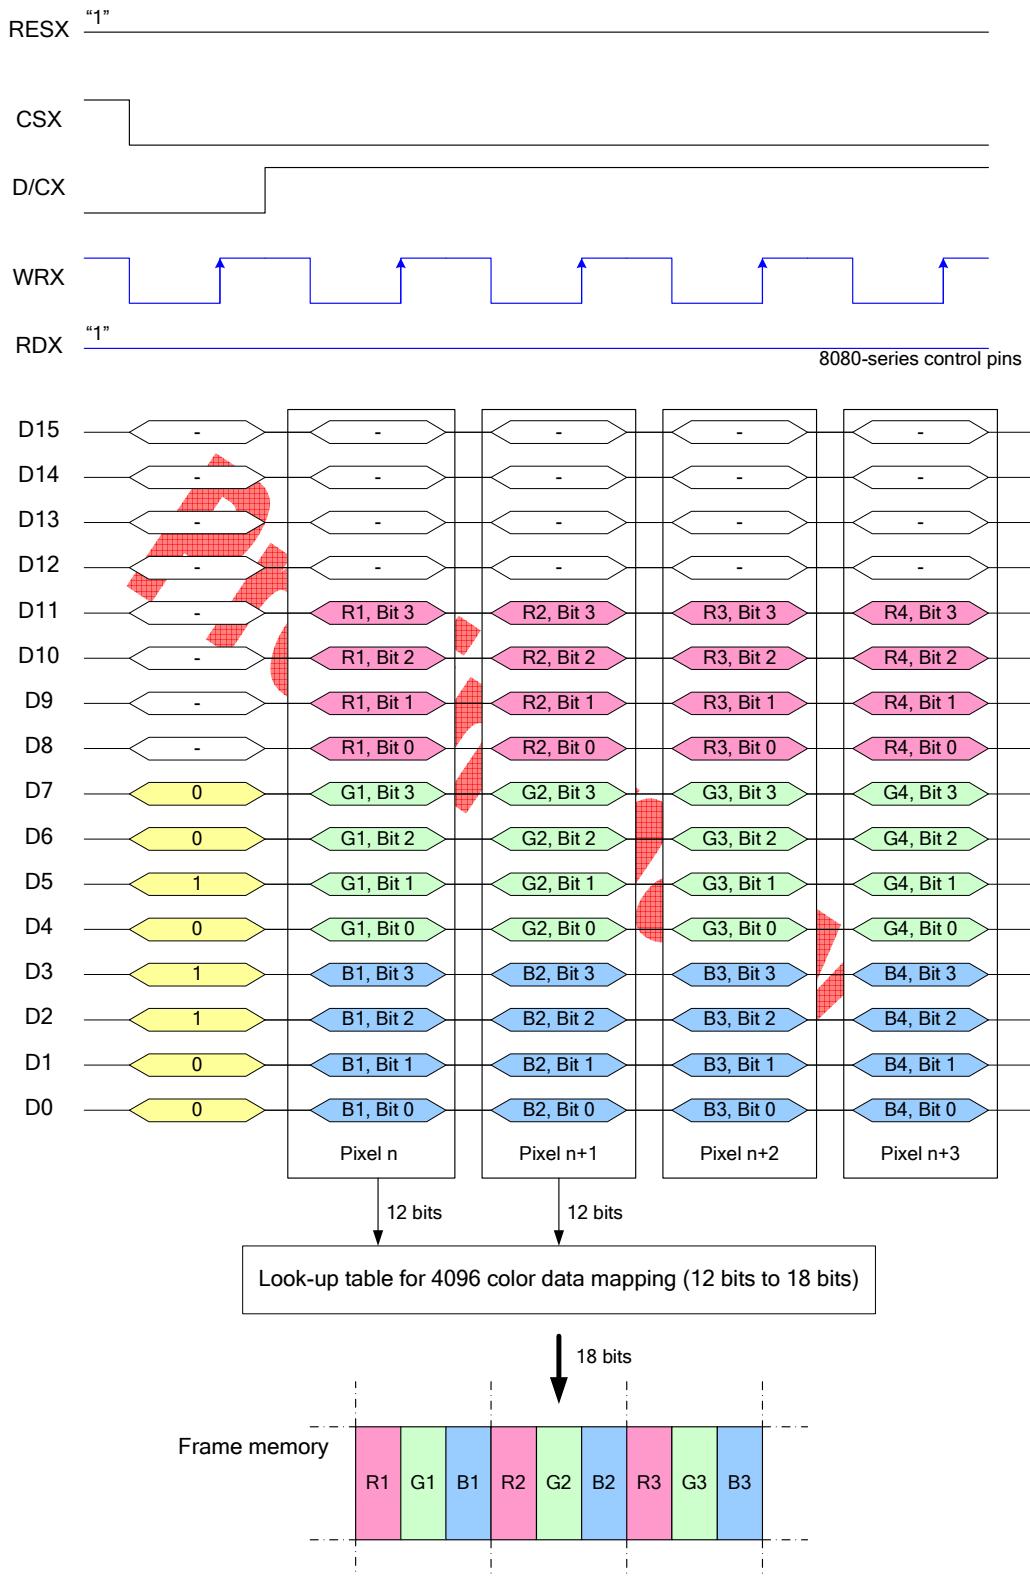

The 8080- I series 16-bit parallel interface of ST7789V can be used by setting IM[3:0] = "0001b". Different display data formats are available for three colors depth supported by listed below.

- 4k colors, RGB 4,4,4-bit input
- 65k colors, RGB 5,6,5-bit input
- 262k colors, RGB 6,6,6-bit input

8.9 RGB Interface

8.9.1 RGB interface Selection

The color format selection of RGB Interface for ST7789V is selected by setting the RIM and command 3Ah, DB[6:4].

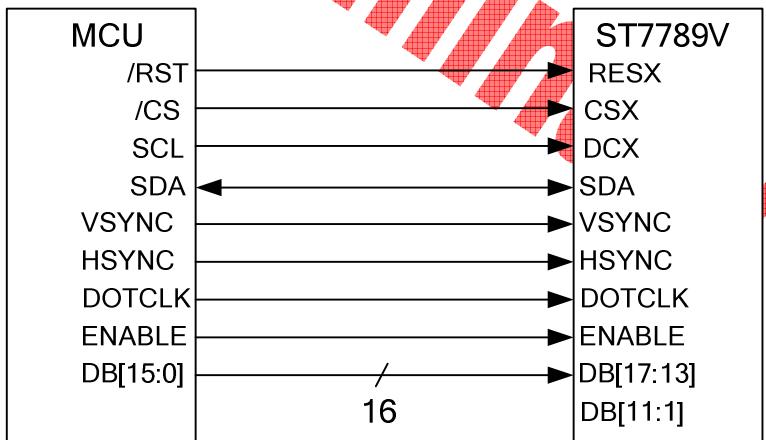

| RIM | 3Ah, DB[6:4] | RGB Interface Mode | Data pins |
|-----|--------------|---------------------------|---------------------|
| 0 | 110 | 18-bit 262K RGB Interface | DB[17:0] |
| 0 | 101 | 16-bit 65K RGB Interface | DB[17:13], DB[11:1] |
| 1 | 110 | 6-bit 262K RGB Interface | DB[5:0] |

8.9.2 RGB Color Format

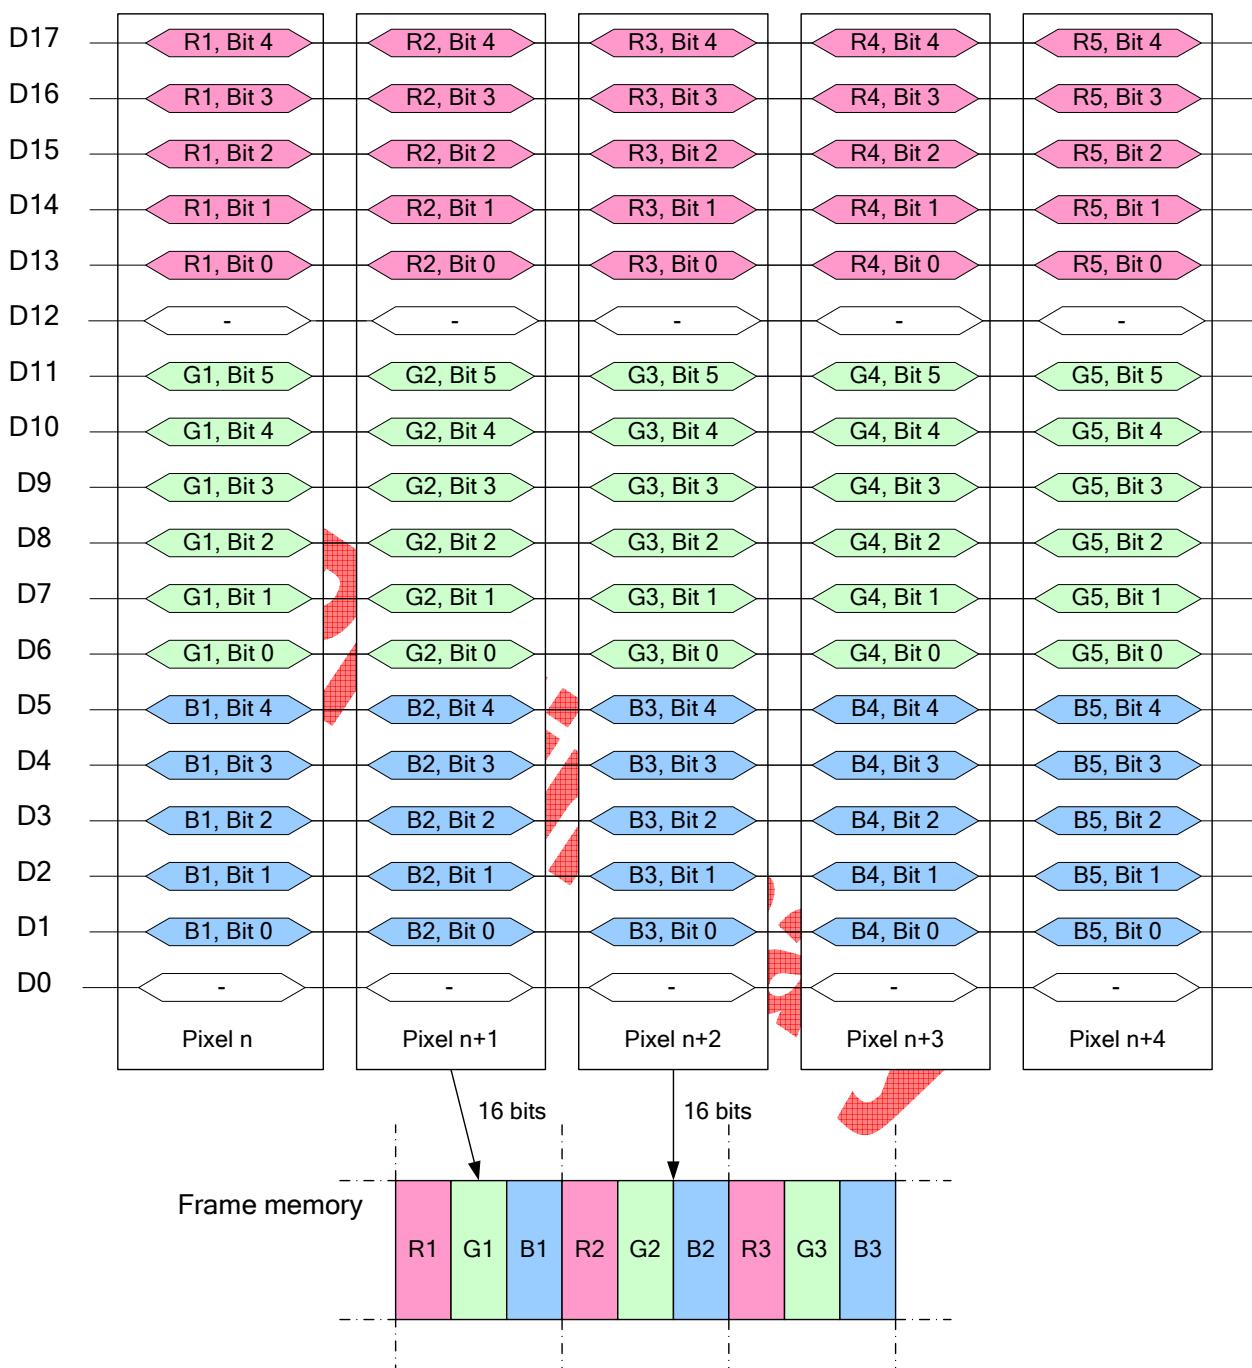

ST7789V supports two kinds of RGB interface, DE mode and HV mode, and 6bit/18bit data format. When DE mode is selected and the VSYNC, HSYNC, DOTCLK, DE, D[17:0] pins can be used; when HV mode is selected and the VSYNC, HSYNC, DOTCLK, D[17:0] pins can be used. When using RGB interface, only serial interface can be selected.

8.9.3 RGB Interface Definition

The display operation via the RGB interface is synchronized with the VSYNC, HSYNC, and DOTCLK signals. The data can be written only within the specified area with low power consumption by using window address function. The back porch and front porch are used to set the RGB interface timing.

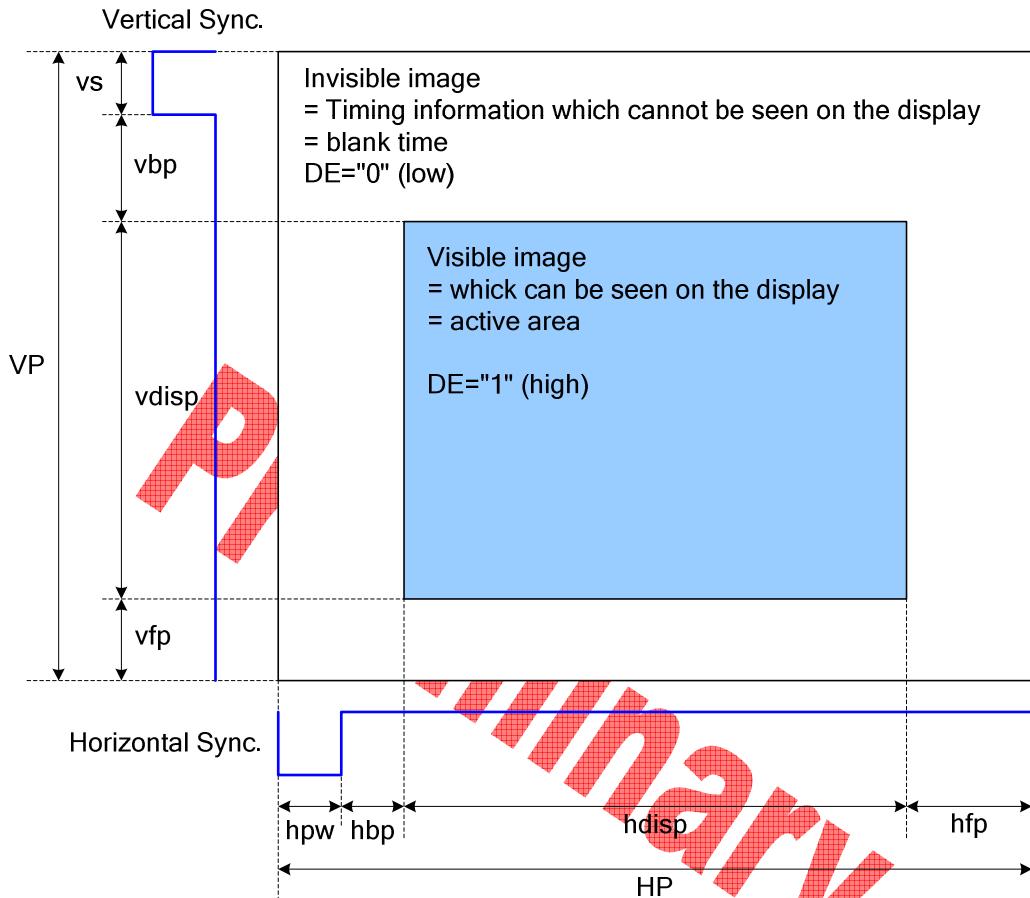

Figure 24 DRAM Access Area by RGB Interface

Please refer to the following table for the setting limitation of RGB interface signals.

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|------------------------------|--------|------|------|------------|-------|
| Horizontal Sync. Width | hbw | 2 | 10 | hbw+hbp=31 | Clock |
| Horizontal Sync. Back Porch | hbp | 4 | 10 | | Clock |
| Horizontal Sync. Front Porch | hfp | 2 | 38 | - | Clock |
| Vertical Sync. Width | vs | 1 | 4 | | Line |
| Vertical Sync. Back Porch | vbp | 1 | 4 | - | Line |
| Vertical Sync. Front Porch | vfp | 1 | 8 | | Line |

Note:

1. Typical value are related to the setting of dot clock is 7MHz and frame rate is 70Hz..
2. If the setting of hbw is 10 dot clocks and hbp is 10 dot clocks, the setting of HBP in command B1h is 20 dot clocks
3. In with ram mode, $hbw+hbp+hfp \geq 22$

4. In without ram mode, $h_{pw}+h_{bp} \geq 20$

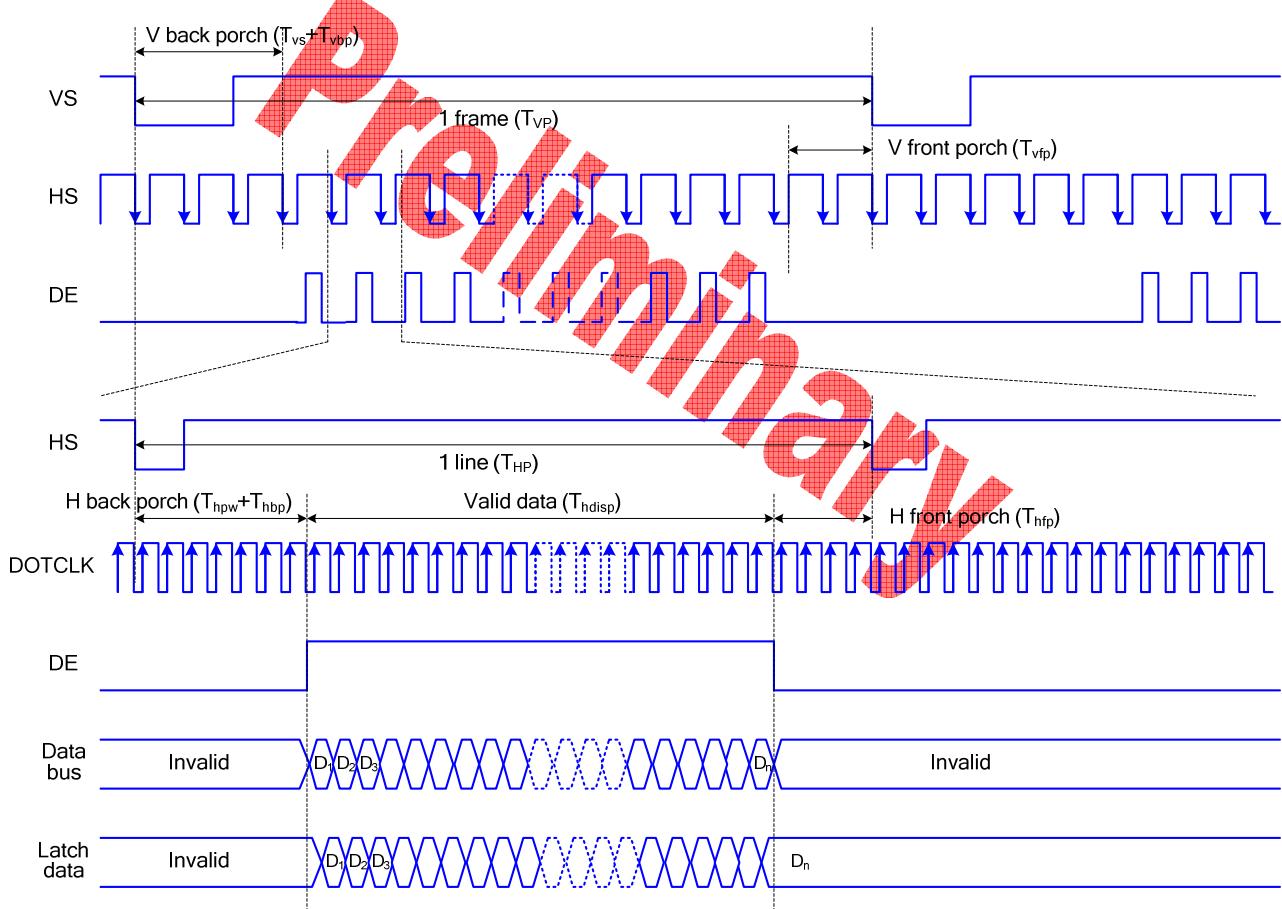

8.9.4 RGB Interface Mode Selection

ST7789V supports two kinds of RGB interface, DE mode and HV mode. Each mode also can select with ram and without ram. The table shown below uses command B1h to select RGB interface mode.

| RCM[1:0] | WO | RGB Mode | Data Path |
|----------|----|----------|------------------------------|
| 10 | 0 | DE mode | Ram |
| | 1 | | Shift register (without Ram) |
| 11 | 0 | HV mode | Ram |
| | 1 | | Shift register (without Ram) |

8.9.5 RGB Interface Timing

The timing chart of RGB interface DE mode is shown as follows.

Note: The setting of front porch and back porch in host must match that in IC as this mode.

Figure 25 Timing Chart of Signals in RGB Interface DE Mode

The timing chart of RGB interface HV mode is shown as follows.

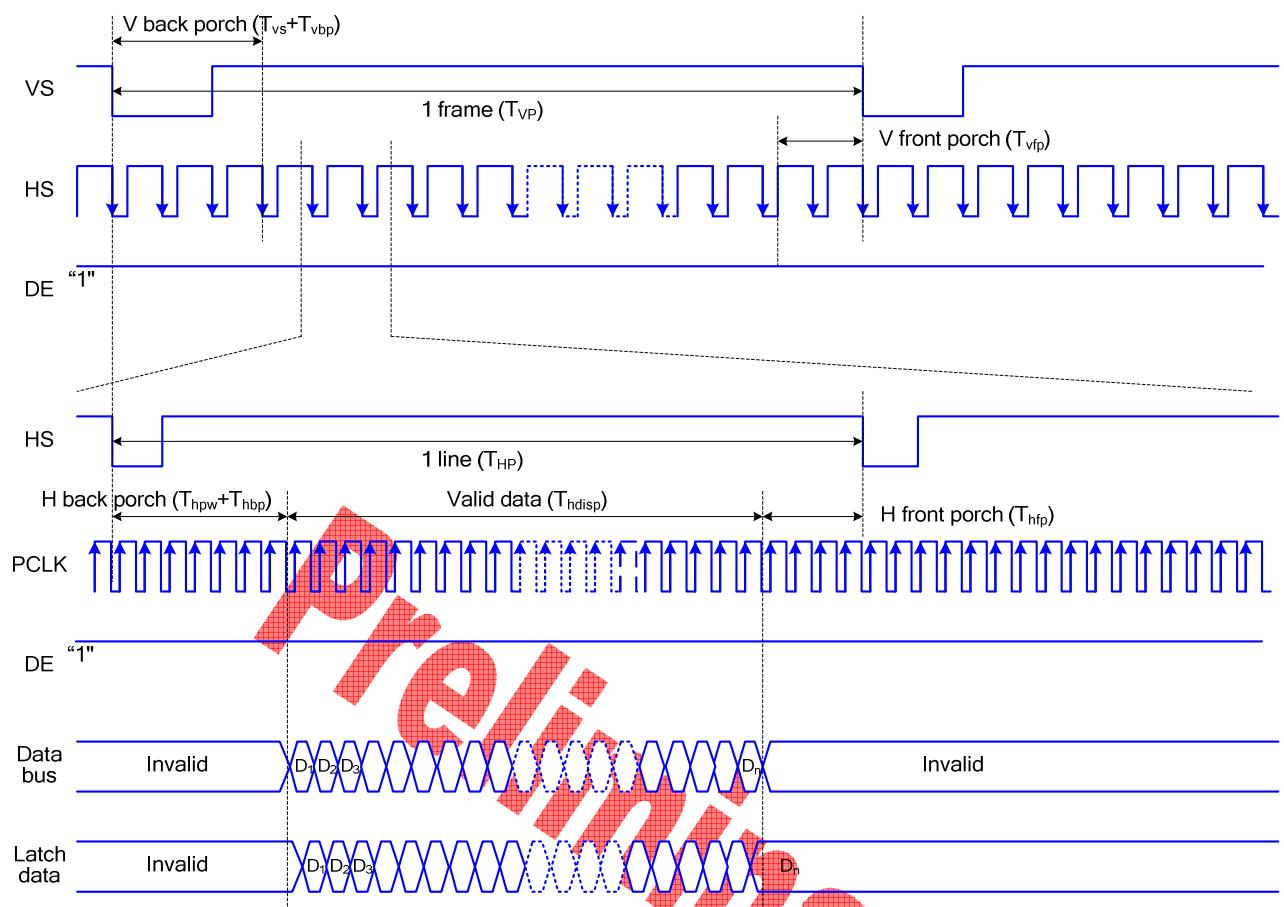

Figure 26 Timing chart of RGB interface HV mod

The following are the functions not available in RGB Input Interface mode.

| Function | RGB Interface | I80 System Interface |
|-----------------------------|---------------|----------------------|
| Partial display | Not available | Available |
| Scroll function | Not available | Available |
| Interlaced scan | Not available | Available |
| Graphics operation function | Not available | Available |

VSYNC, HSYNC, and DOTCLK signals must be supplied during a display operation period.

In RGB interface mode, the panel controlling signals are generated from DOTCLK, not the internal clock generated from the internal oscillator.

In 6-bit RGB interface mode, each of RGB dots are transferred in synchronization with DOTCLK signals.

In other words, one pixel data needs to take three DOTCLKs to transfer.

In 6-bit RGB interface mode, the cycles of VSYNC, HSYNC, ENABLE, DOTCLK signals must be set correctly so that the data transfer is completed in units of pixels.

When switching between the internal operation mode and the external display interface operation mode, follow the sequences below in setting instruction.

In RGB interface mode, the front porch period continues until the next VSYNC input is detected after drawing one frame.

In RGB interface mode, a RAM address is set in the address counter every frame on the falling edge of VSYNC.

Preliminary

8.10 VSYNC Interface

8.10.1 18-bit RGB Interface

The ST7789V incorporates VSYNC interface, which enables motion pictures to be displayed with only the conventional system interface and the frame synchronization signal (VSYNC). This interface requires minimal changes from the conventional system to display motion pictures. In this interface the internal display operation is synchronized with VSYNC. Data for display is written to RAM via the system interface with higher speed than for internal display operation. This method enables tearing-free display of motion pictures with the conventional interface.

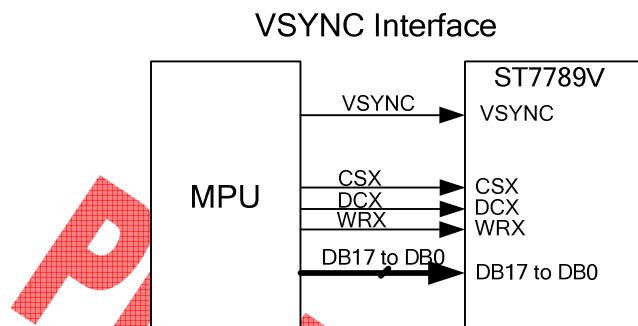

Figure 27 Data transmission through VSYNC interface

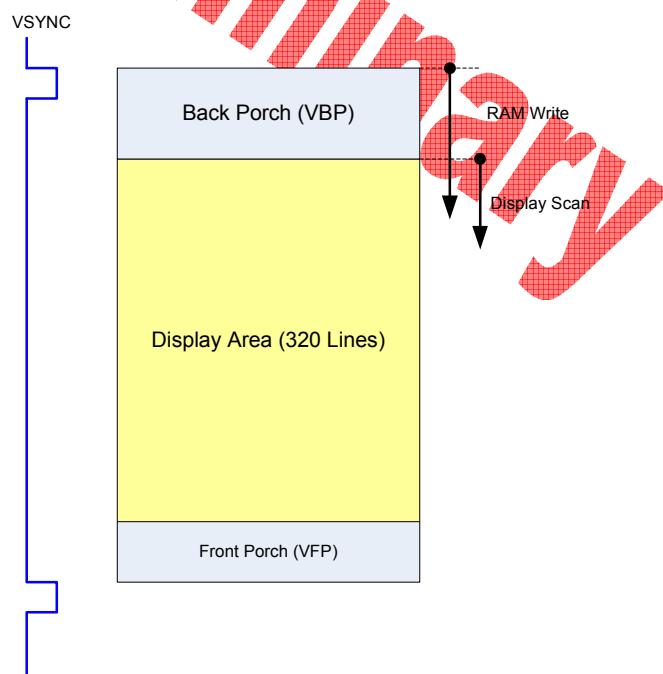

Figure 28 Operation through VSYNC Interface

Display operation can be achieved by using the internal clock generated by the internal oscillator and the VSYNC input. Because all the data for display is written to RAM, only the data to be rewritten is transferred. This method reduces the amount of data transferred during motion picture display operation.

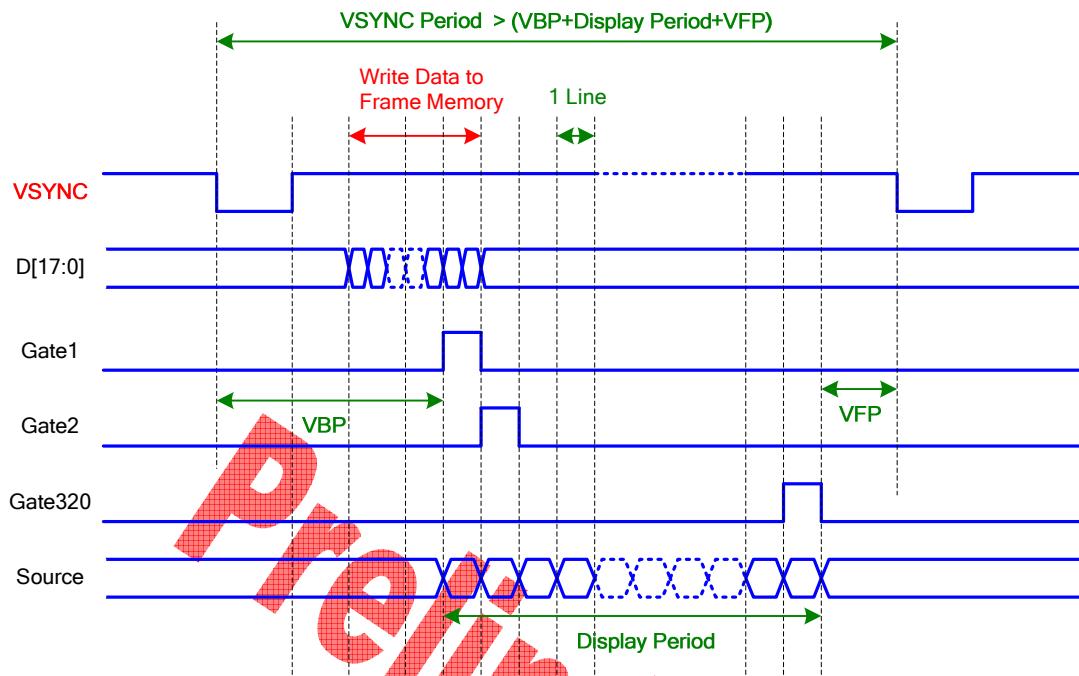

Figure 29 Timing Diagram of VSYNC Interface

VSYNC interface requires taking the minimum speed for RAM writing via the system interface and the frequency of the internal clock into consideration. RAM writing should be performed with higher speed than the result obtained from the calculation shown below. The internal memory writing address counter is reset by VSYNC. So, insure interval time between VSYNC falling and DRAM data writing.

Note:

1. VSYNC period should always be constant. If not, some degradation of display such as flicker may occur in LCD system.
2. Display data don't need to be written for every VSYNC period. For example, any system is working under 60Hz frame rate and 30-fps motion picture condition. So being written display data for every other frame would be enough.

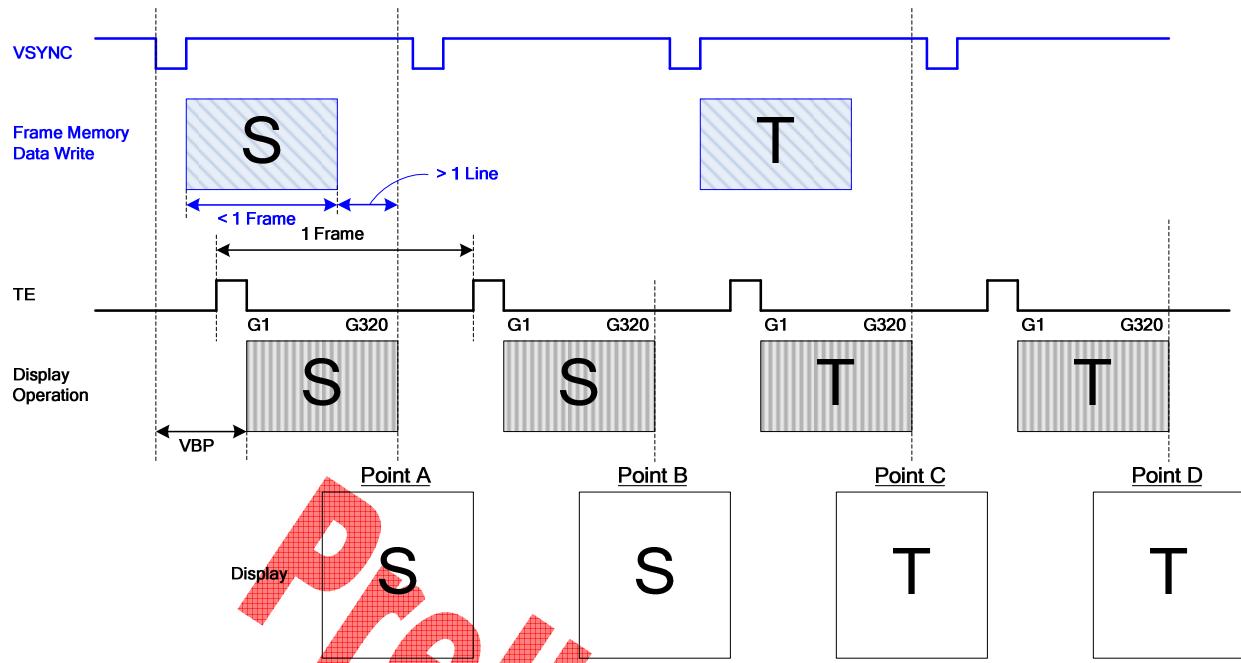

Figure 30 Operation for Leading Mode of VSYNC Interface

Lagging Mode

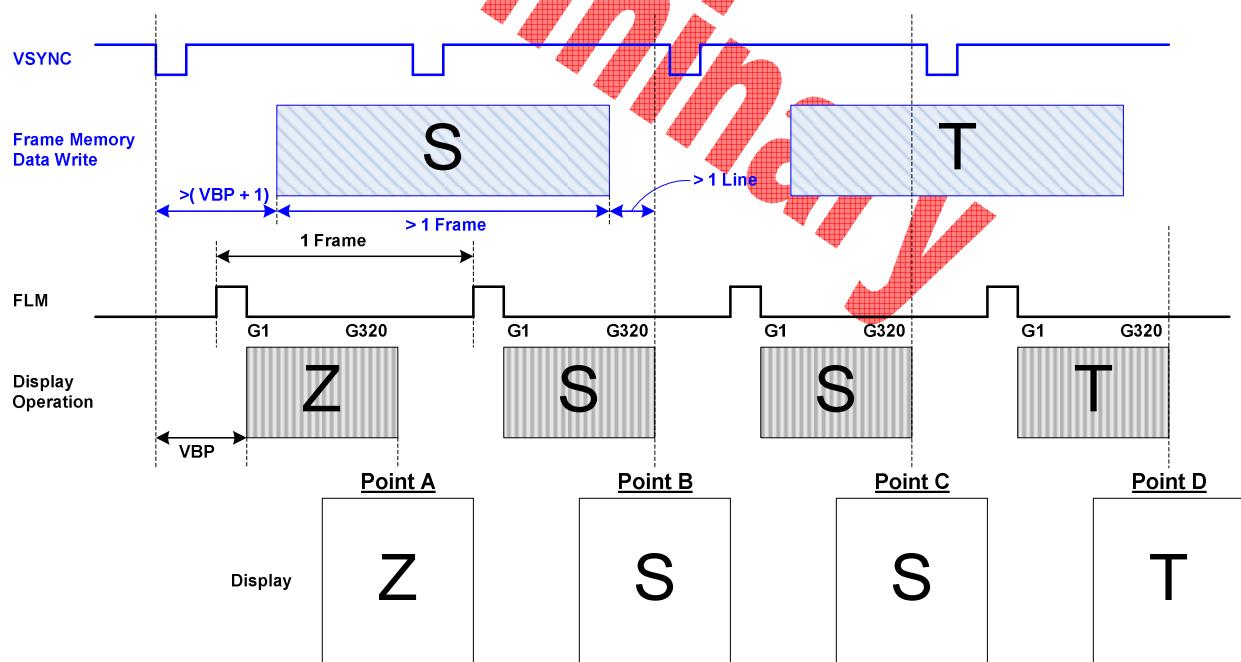

Figure 31 Operation for Lagging Mode of VSYNC Interface

Notes:

1. When RAM writing does not start immediately after the falling edge of VSYNC, the time between the falling edge of VSYNC and the RAM writing start timing must also be considered.
1. The minimum DRAM write speed must be satisfied and the frequency variation must be taken into consideration.
2. The display frame rate is determined by the VSYNC signal and the period of VSYNC must be longer than the scan period of an entire display.
3. When switching from the internal clock operation mode to the VSYNC interface mode or inversely, the switching starts from the next VSYNC cycle, i.e. after completing the display of the frame.
4. The partial display, vertical scroll, and interlaced scan functions are not available in VSYNC interface mode and set the AM bit to "0" to transfer display data.

Preliminary

8.11 Display Data RAM

8.11.1 Configuration

The display module has an integrated 240x320x18-bit graphic type static RAM. This 1382400-bit memory allows storing on-chip a 240xRGBx320 image with an 18-bpp resolution (262K-color). There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

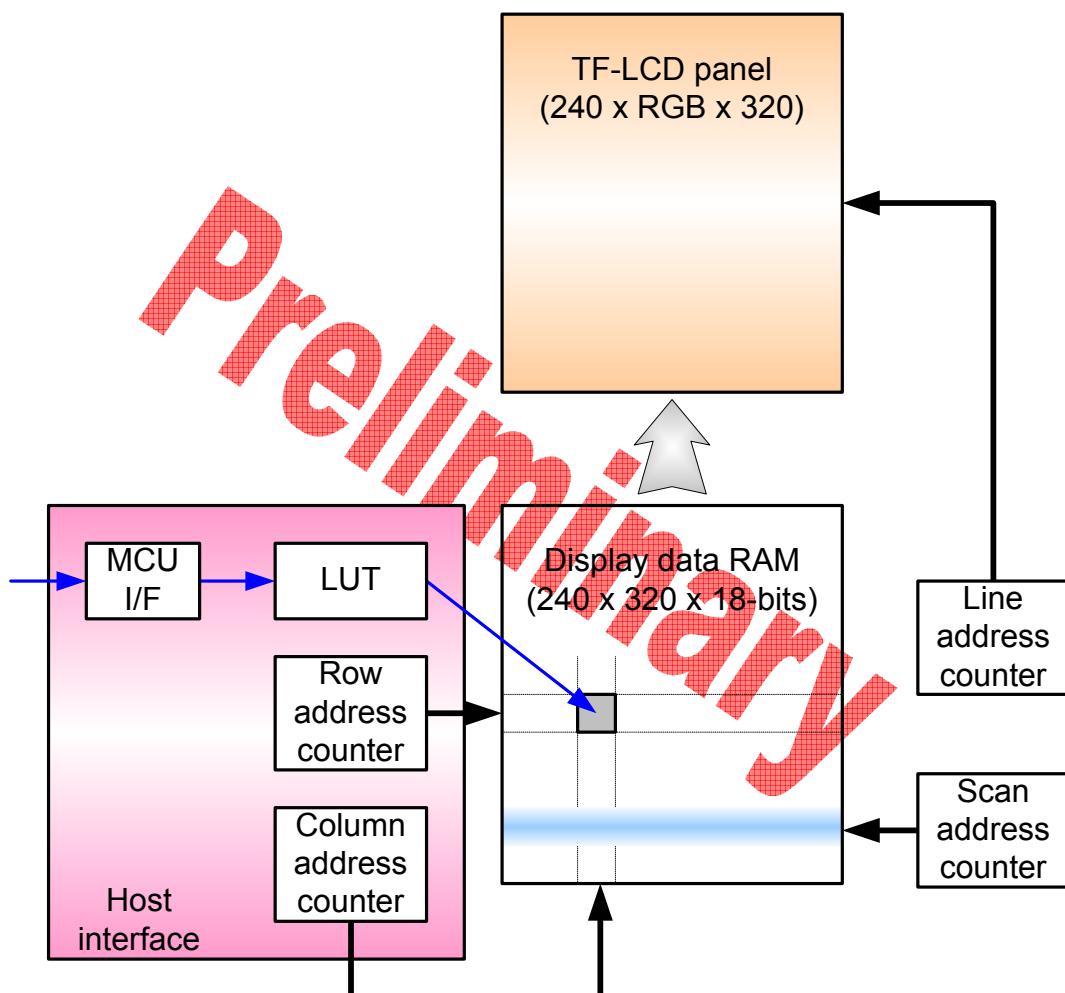

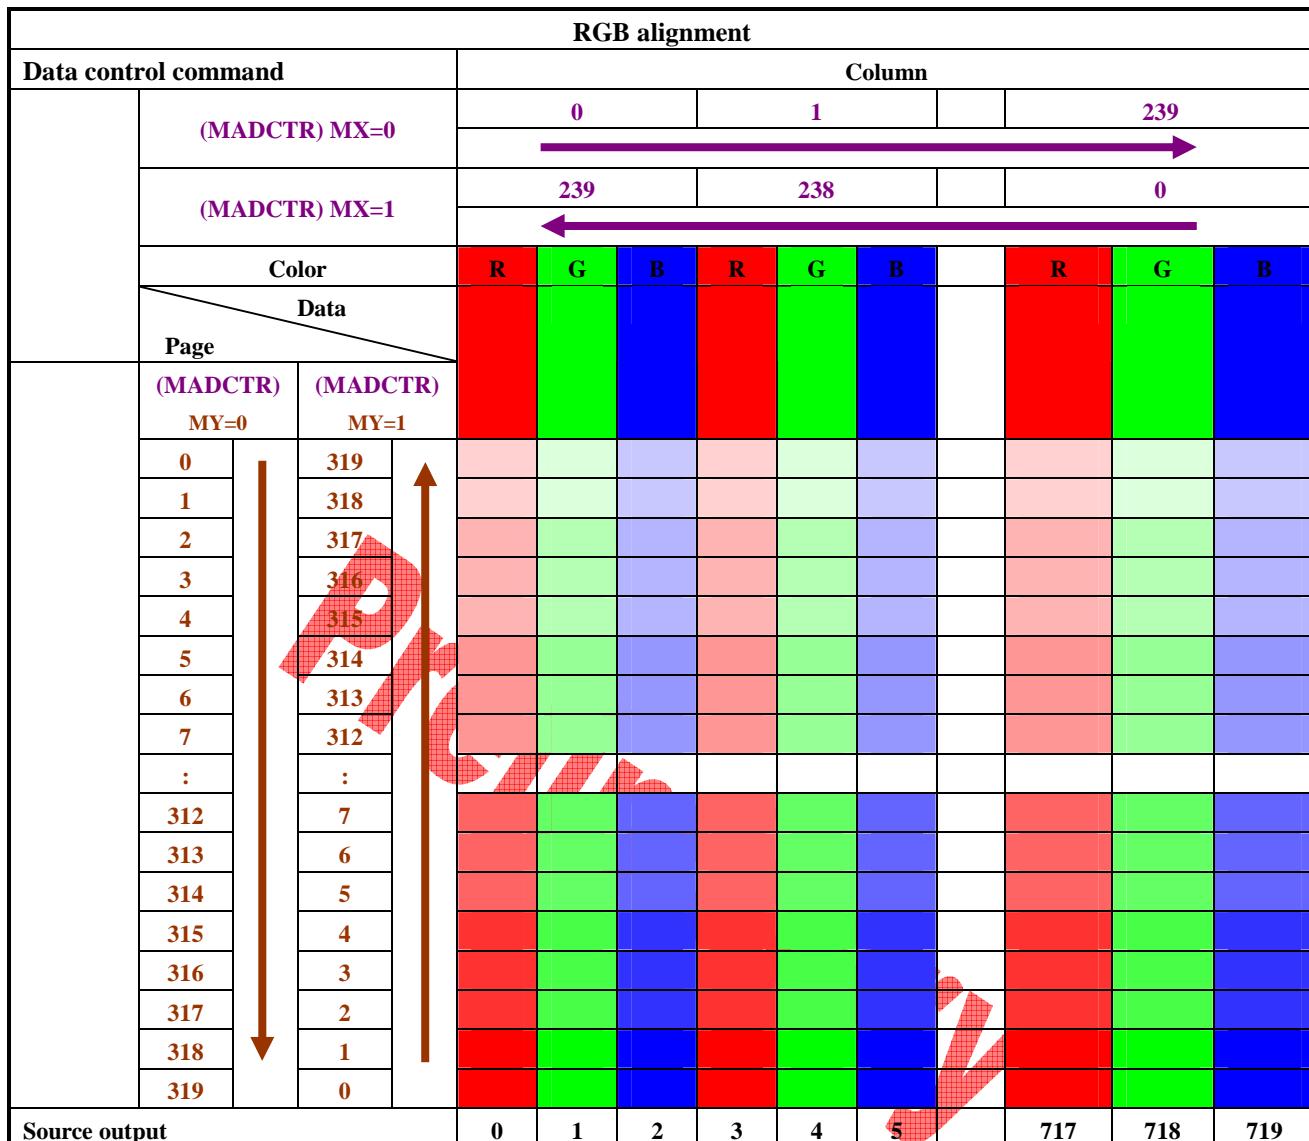

Figure 32 Display data RAM organization

8.11.2 Memory to display address mapping

8.12 Address Control

The address counter sets the addresses of the display data RAM for writing and reading.

Data is written pixel-wise into the RAM matrix of DRIVER. The data for one pixel or two pixels is collected (RGB 6-6-6-bit), according to the data formats. As soon as this pixel-data information is complete the “Write access” is activated on the RAM. The locations of RAM are addressed by the address pointers. The address ranges are X=0 to X=239 (Ef_h) and Y=0 to Y=319 (13F_h). Addresses outside these ranges are not allowed. Before writing to the RAM, a window must be defined that will be written. The window is programmable via the command registers XS, YS designating the start address and XE, YE designating the end address.

For example the whole display contents will be written, the window is defined by the following values: XS=0 (0h) YS=0 (0h) and XE=239 (Ef_h), YE=319 (13F_h).

In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (V=0), the X-address increments after each byte, after the last X-address (X=XE), X wraps around to XS and Y increments to address the next row. After the every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS).

For flexibility in handling a wide variety of display architectures, the commands “CASET, RASET and MADCTL”, define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Section 8.12 show the available combinations of writing to the display RAM. When MX, MY and MV will be changed the data bust be rewritten to the display RAM.

For each image condition, the controls for the column and row counters apply as below

| Condition | Column Counter | Row Counter |
|--|----------------------------------|-------------------------------|
| When RAMWR/RAMRD command is accepted | Return to “Start Column (XS)” | Return to “Start Row (YS)” |
| Complete Pixel Read / Write action | Increment by 1 | No change |
| The Column counter value is larger than “End Column (XE)” | Return to “Start Column (XS)” | Increment by 1 |
| The Column counter value is larger than “End Column (XE)” and the Row counter value is larger than “End Row (YE)” | Return to “Start Column (XS)” | Return to “Start Row (YS)” |

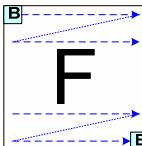

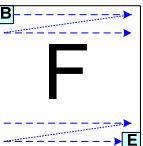

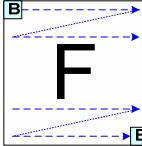

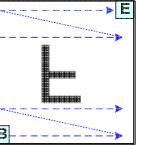

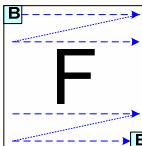

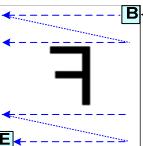

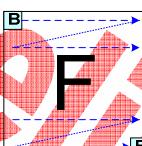

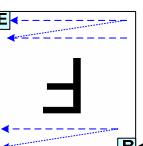

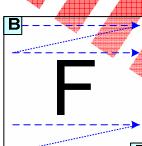

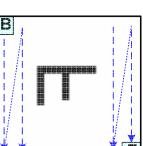

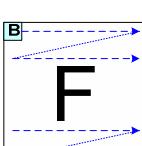

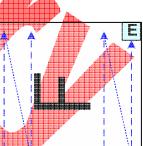

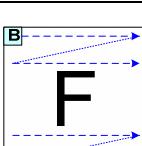

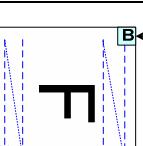

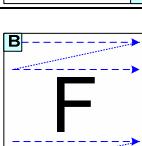

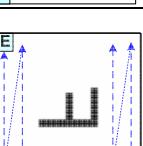

| Display Data Direction | MADCTR Parameter | | | Image in the Host (MPU) | Image in the Driver (DDRAM) |
|--------------------------------------|------------------|----|----|---|---|
| | MV | MX | MY | | |
| Normal | 0 | 0 | 0 |  |  |

8.13 Normal Display On or Partial Mode On, Vertical Scroll Off

In this mode, contents of the frame memory within an area where column address is 00h to 83h and row address is 00h to 83h is displayed.

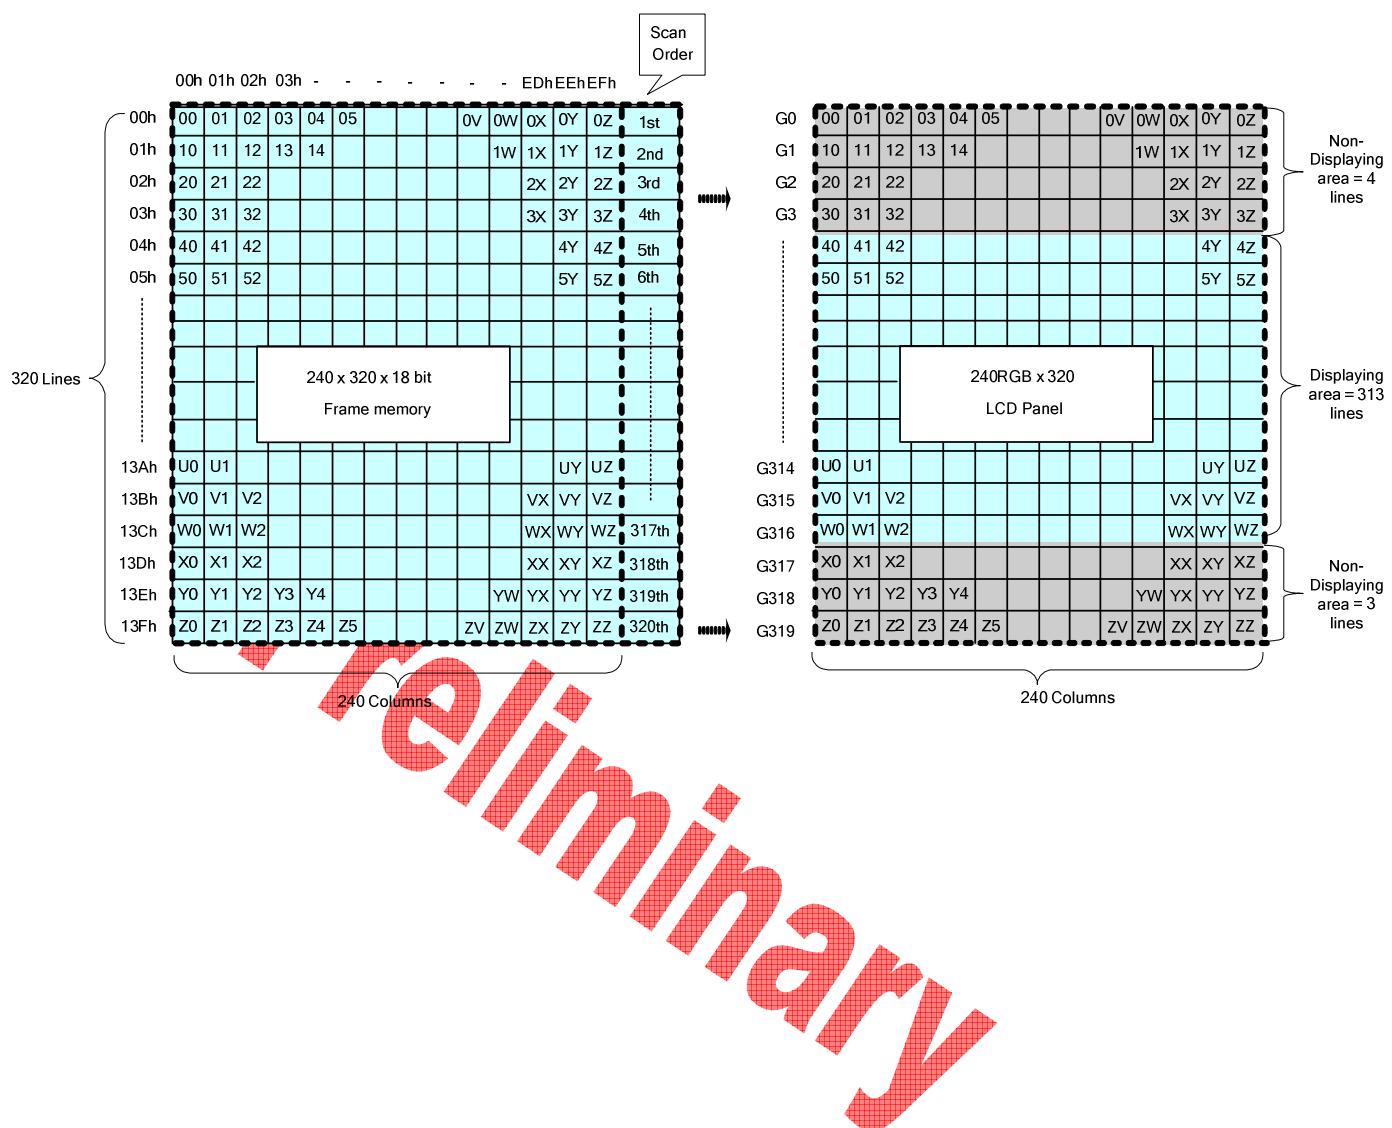

83h is displayed.

To display a dot on leftmost top corner, store the dot data at (column address, row address) = (0,0).

Example1) Normal Display On

Example2) Partial Display On: PSL[15:0] = 0004h, PEL[15:0] = 013Ch, MADCTR (ML)=0

8.14 Vertical Scroll Mode

8.14.1 Rolling scroll

There is just one types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

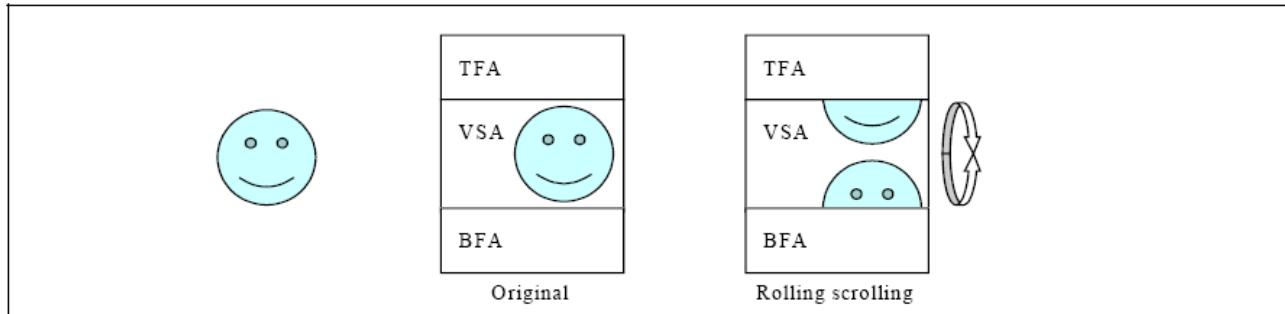

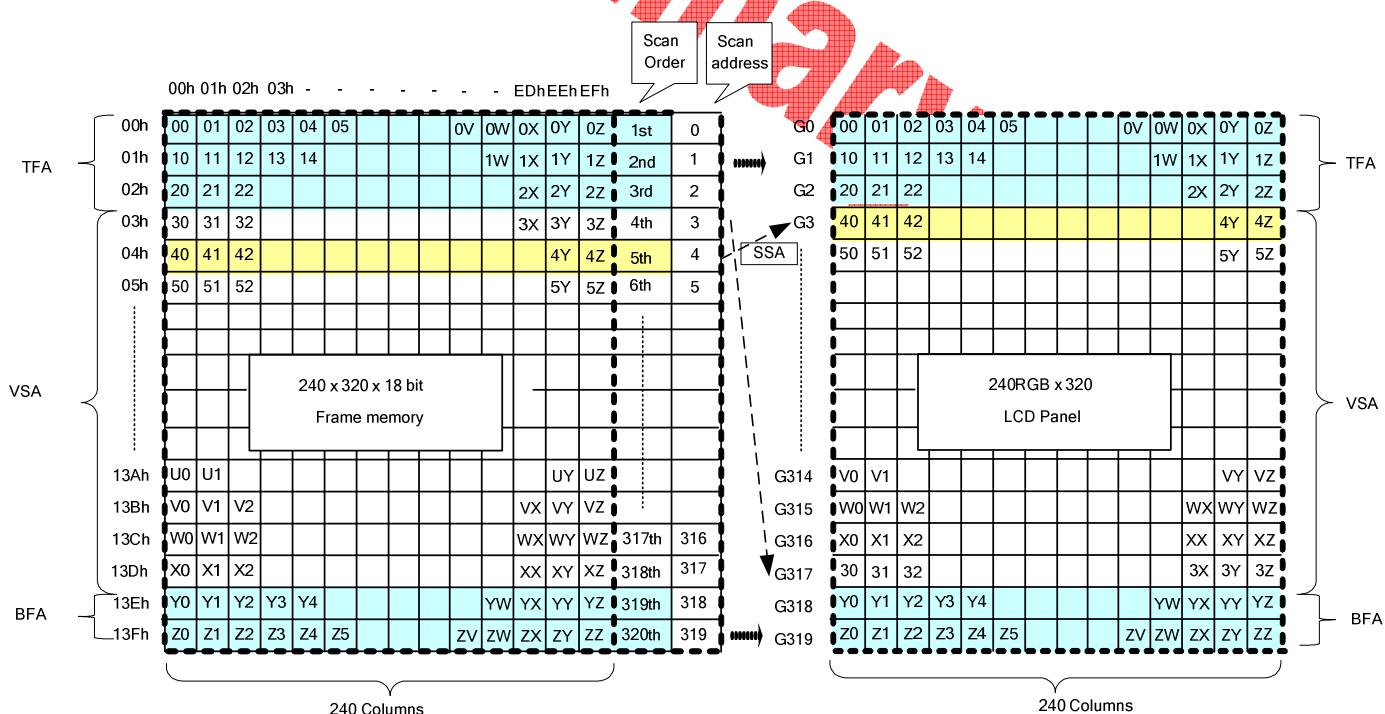

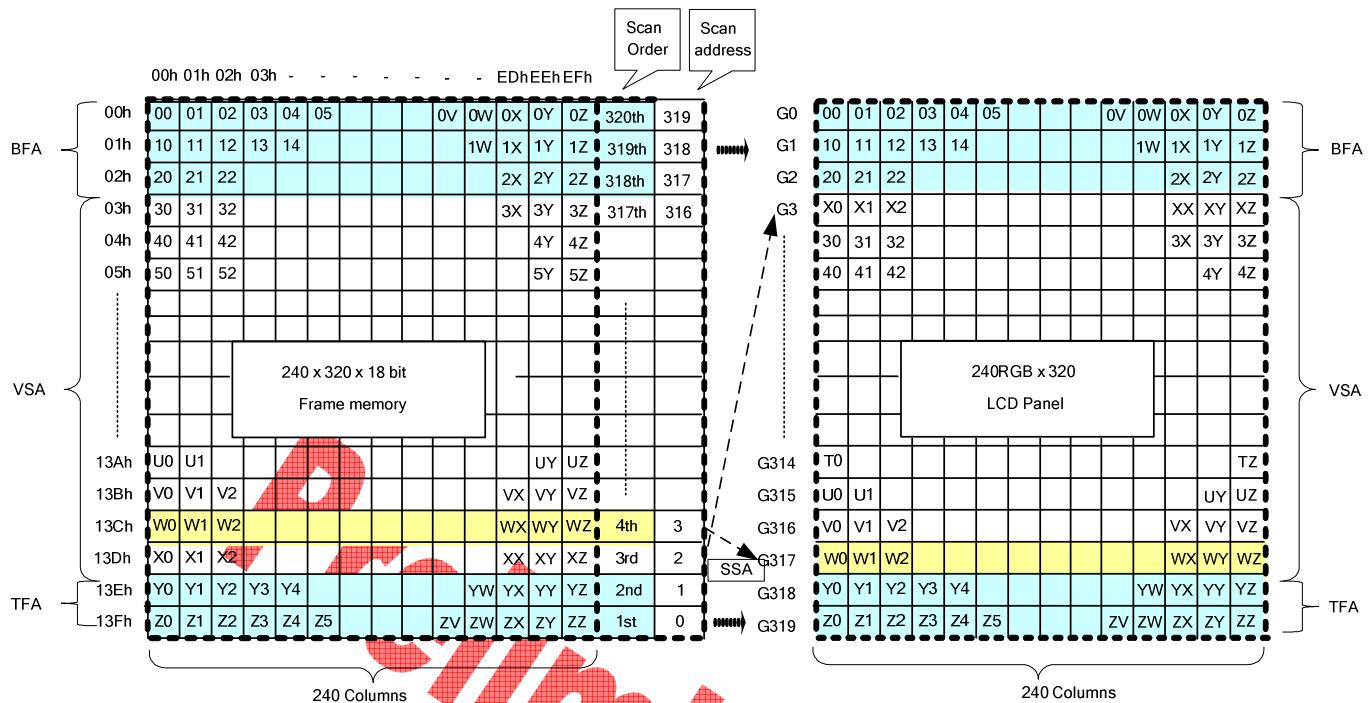

Figure 34 Rolling Scroll Definition

When Vertical Scrolling Definition Parameters ($TFA + VSA + BFA = 320$). In this case, 'rolling' scrolling is applied as shown below. All the memory contents will be used.

Example1) Panel size=240 x 320, TFA=3, VSA=315, BFA=2, SSA=4, MADCTR ML=0: Rolling Scroll

Example2) Panel size=132 x 132, TFA =2, VSA=315, BFA=3, SSA=4, MADCTR ML=1: Rolling Scroll
(TFA and BFA are exchanged)

8.14.2 Vertical Scroll Example

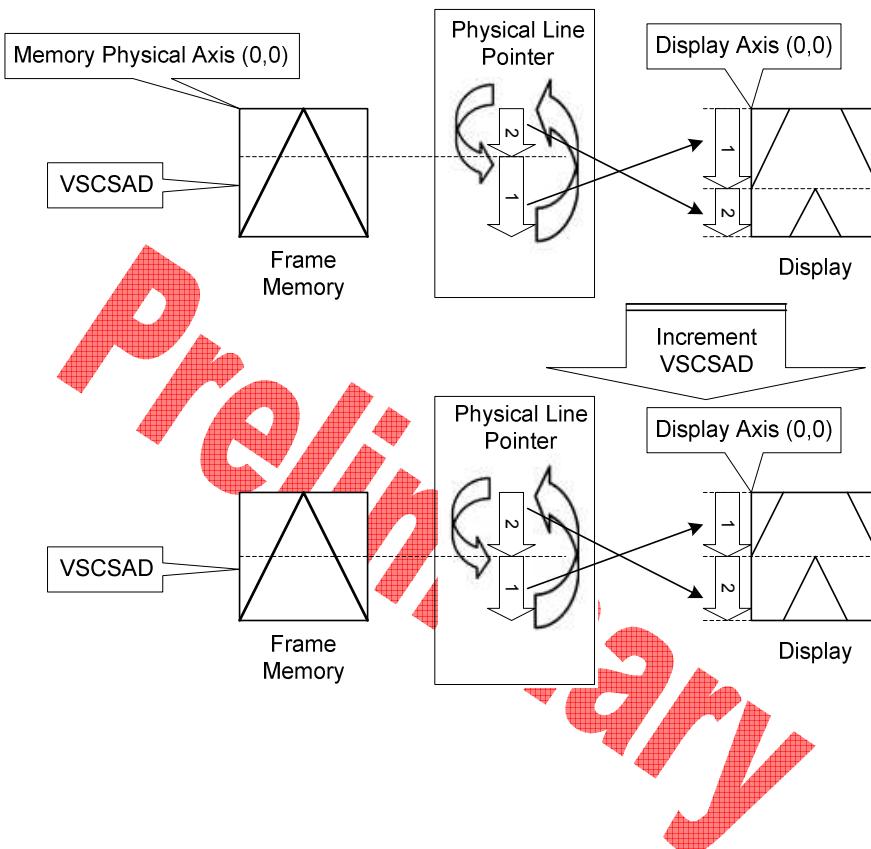

There are 2 types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

Case 1: TFA + VSA + BFA<320

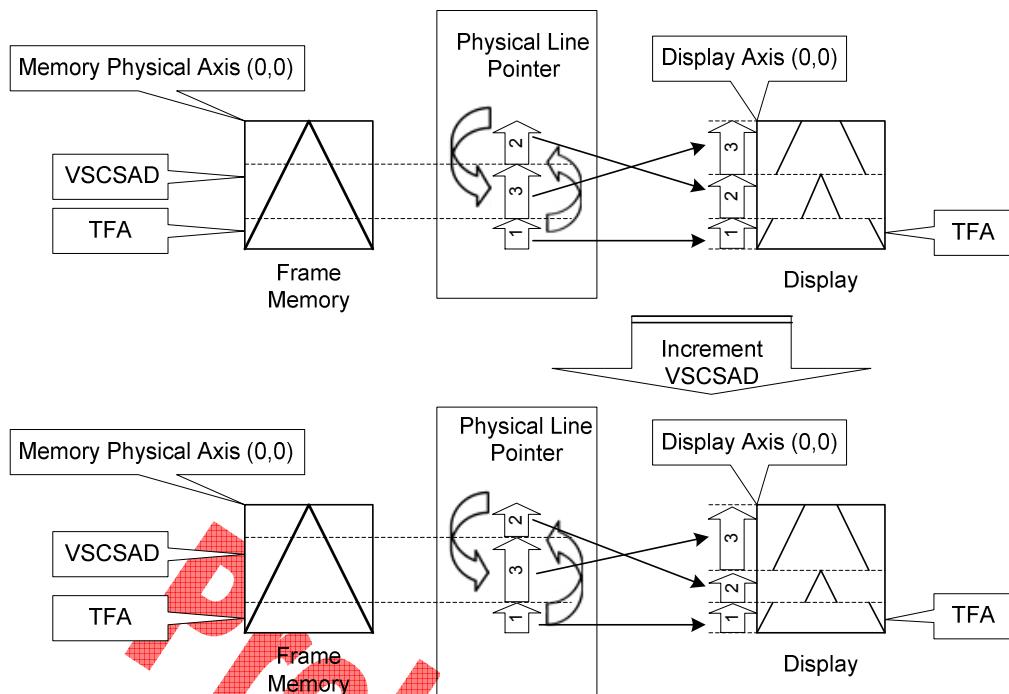

N/A. Do not set TFA + VSA + BFA<320. In that case, unexpected picture will be shown.

Case 2: TFA + VSA + BFA=320 (Rolling Scrolling)

Example1) When MADCTR parameter ML="0", TFA=0, VSA=320, BFA=0 and VSCSAD=40.

Example2) When MADCTR parameter ML="1", TFA=10, VSA=310, BFA=0 and VSCSAD=30.

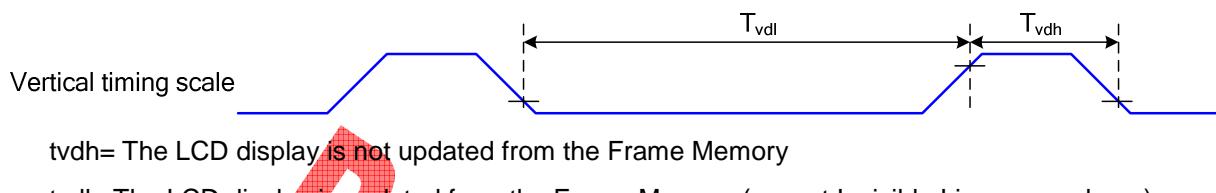

8.15 Tearing Effect

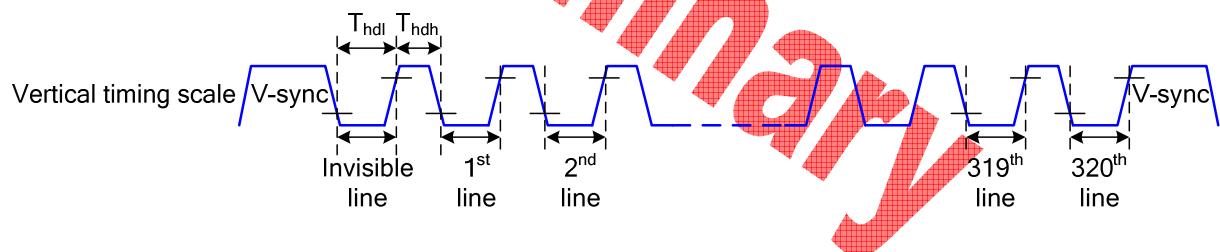

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing **when displaying video images**.

8.15.1 Tearing effect line modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

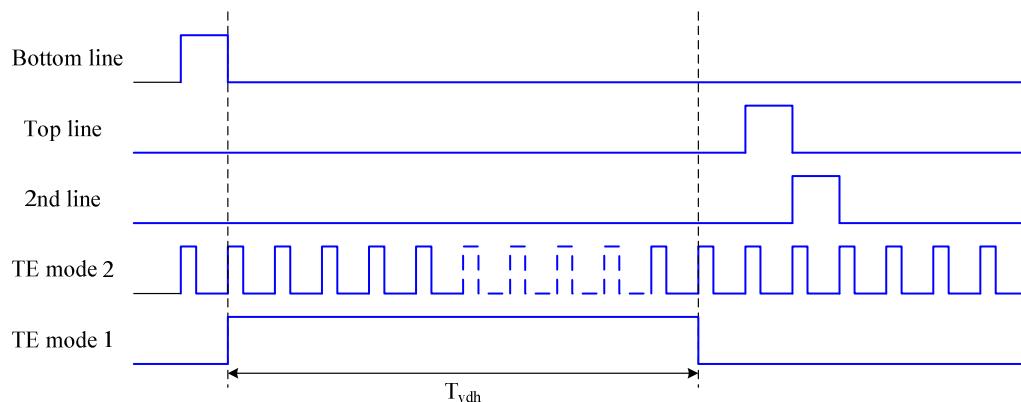

Mode 2, the Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 320 H-sync pulses per field.

thdh= The LCD display is not updated from the Frame Memory

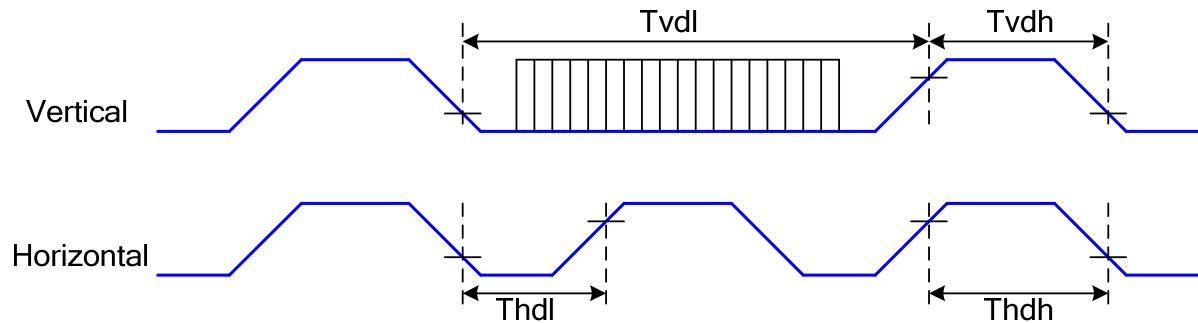

thdl= The LCD display is updated from the Frame Memory (except Invisible Line – see above)

Note: During Sleep In Mode, the Tearing Output Pin is active Low.

8.15.2 Tearing effect line timings

The Tearing Effect signal is described below:

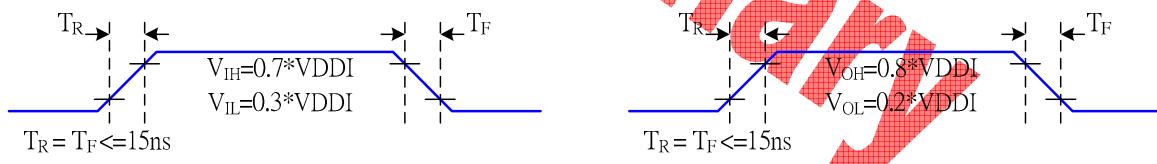

| Symbol | Parameter | min | max | unit | description |
|--------|--------------------------------|------|-----|------|-------------|
| $tvdl$ | Vertical Timing Low Duration | 13 | - | ms | |
| $tvdh$ | Vertical Timing High Duration | 1000 | - | μs | |
| $thdl$ | Horizontal Timing Low Duration | 33 | - | μs | |
| $thdh$ | Horizontal Timing Low Duration | 25 | 500 | μs | |

Table 16 AC characteristics of Tearing Effect Signal Idle Mode Off (Frame Rate = 60 Hz, Ta=25°C)

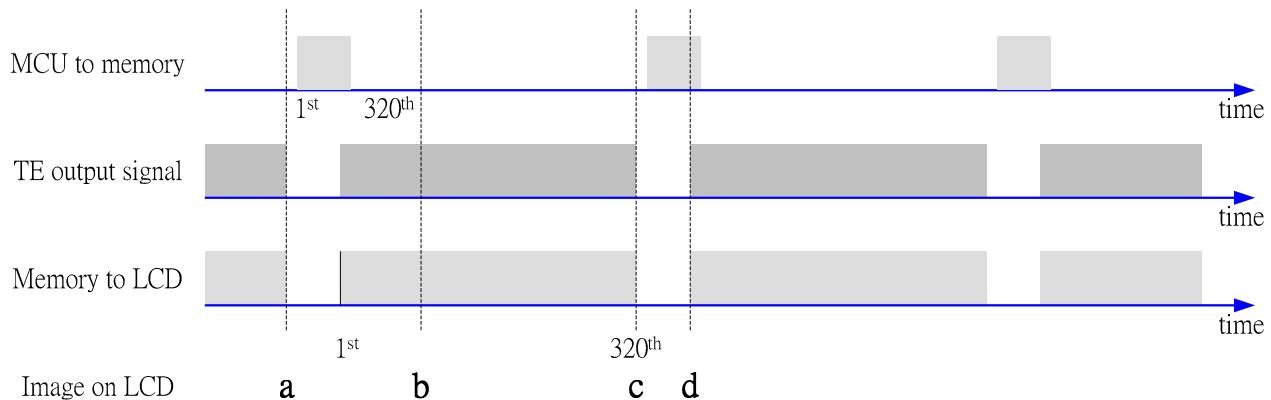

Note: The timings in Table 15 apply when MADCTL ML=0 and ML=1

The signal's rise and fall times (t_f , t_r) are stipulated to be equal to or less than 15ns.

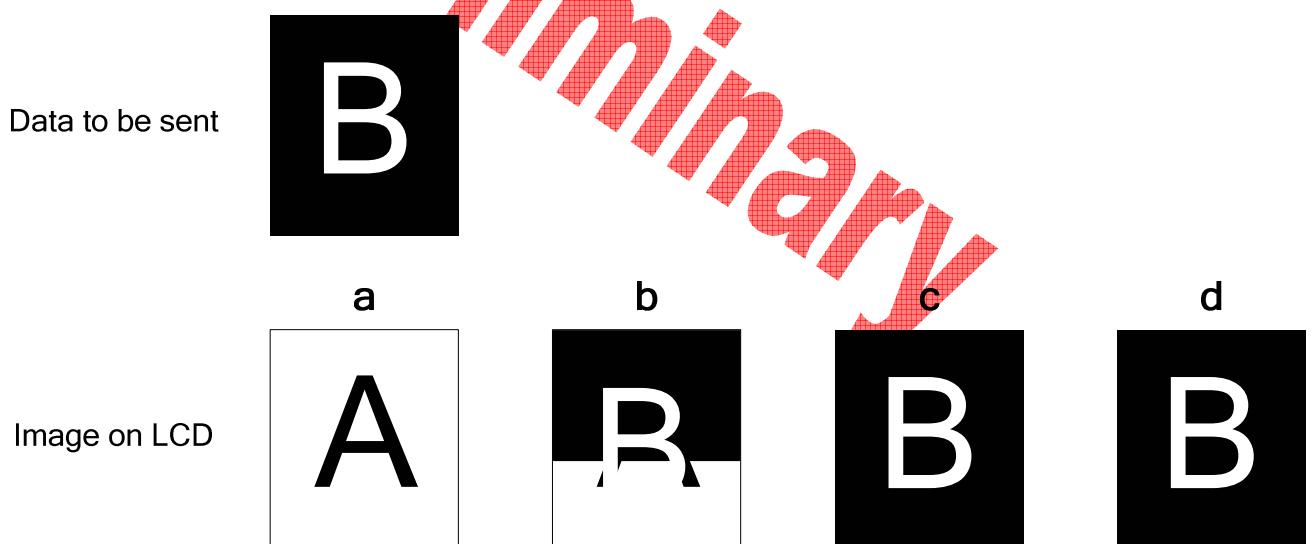

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

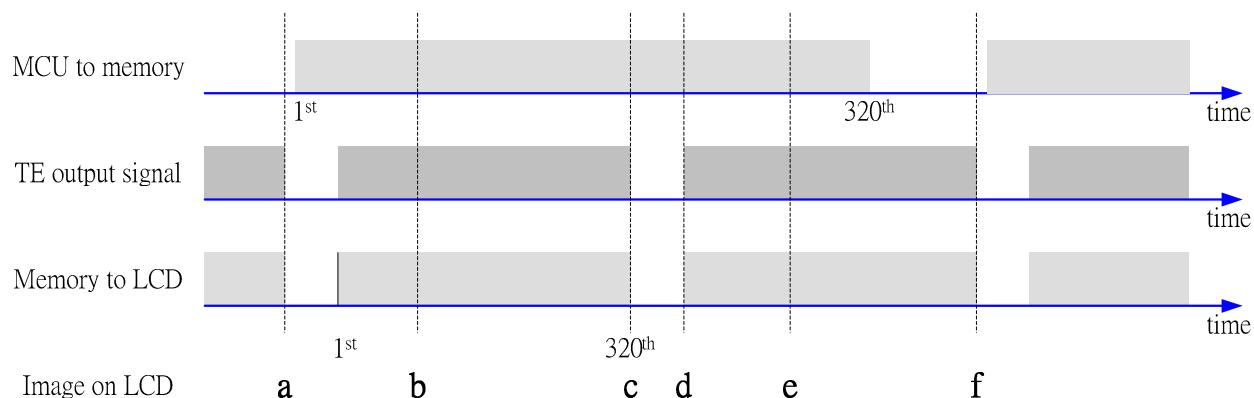

8.15.3 Example 1: MPU Write is faster than panel read

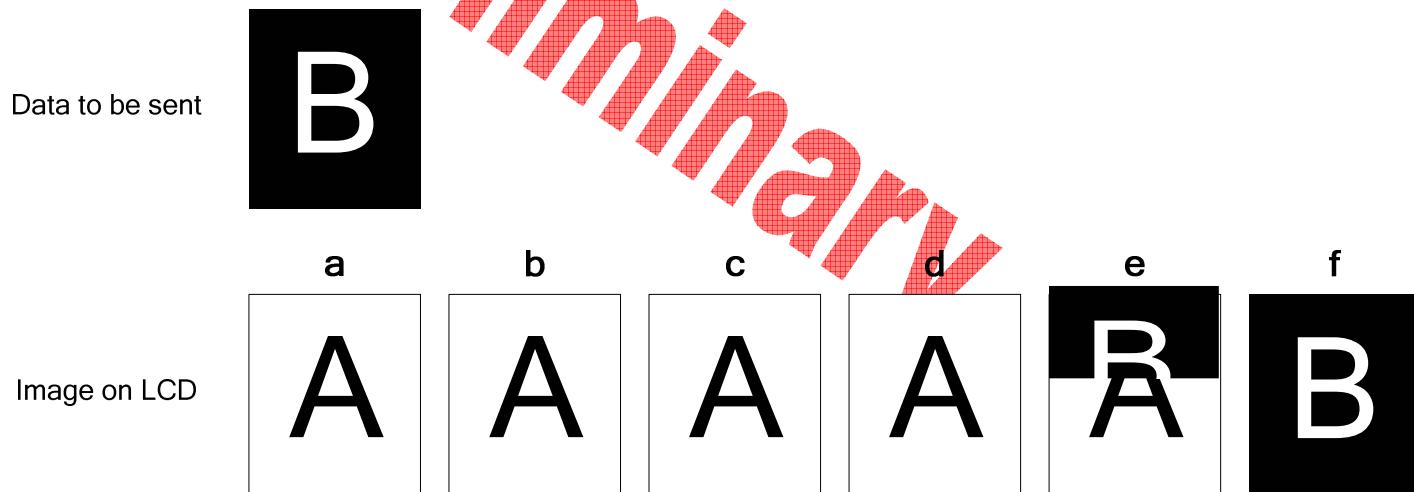

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

8.15.4 Example 2: MPU write is slower than panel read

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer "catches" the MPU to Frame memory write position.

8.16 Power ON/OFF Sequence

Power on/off sequence suggestion:

VDD powered on before the VDDI.

VDDI powered off before the VDD.

During power off, if LCD is in the Sleep Out mode, VDD and VDDI must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, VDDI or VDD can be powered down minimum 0msec after RESX has been released.

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

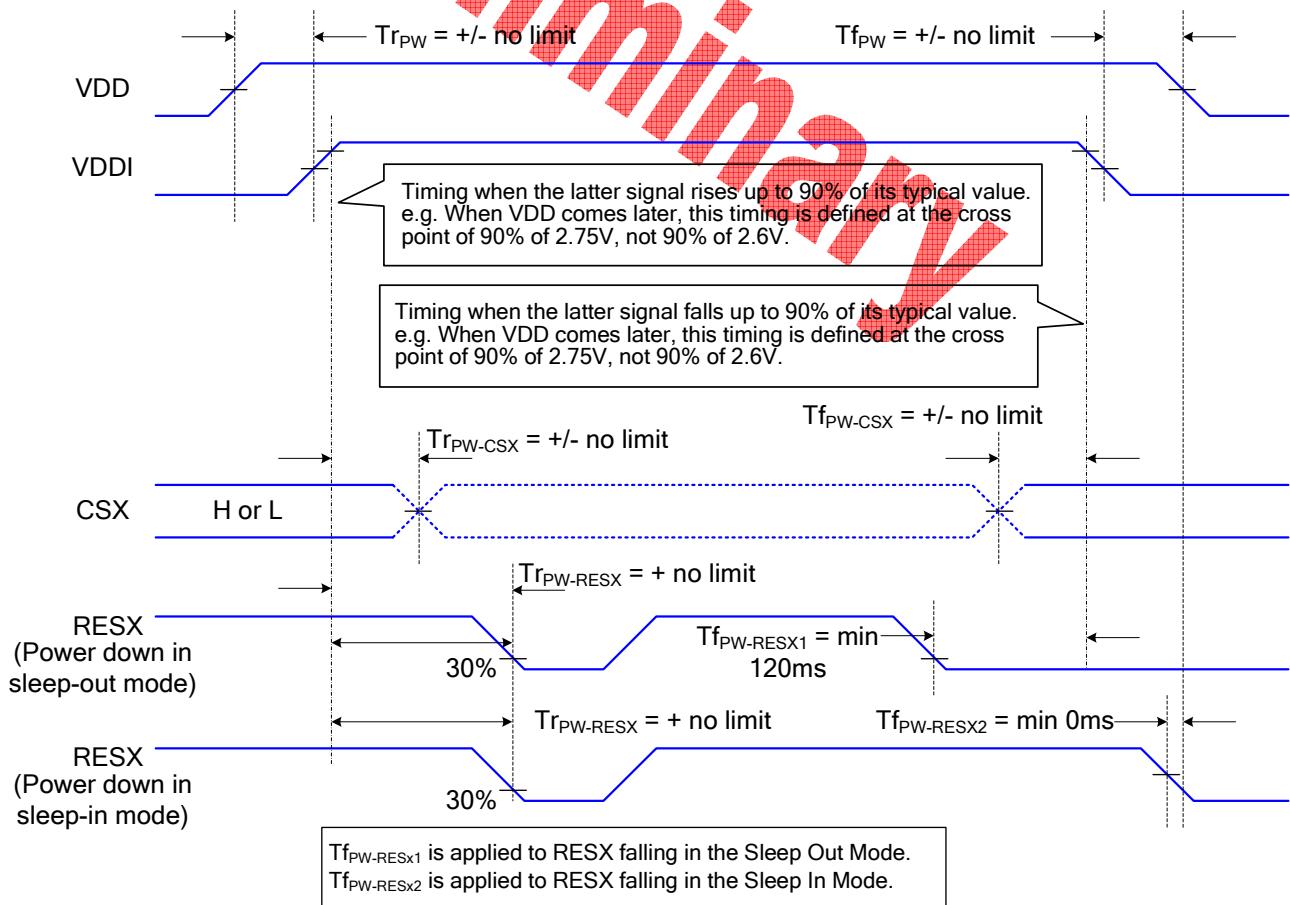

Note 1: There will be no damage to the display module if the power sequences are not met.

Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

Note 4: If RESX line is not held stable by host during Power On Sequence as defined in the sequence below, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

The power on/off sequence is illustrated below

8.16.1 Uncontrolled Power Off

The uncontrolled power-off means a situation which removed a battery without the controlled power off sequence. It will neither damage the module or the host interface.

If uncontrolled power-off happened, the display will go blank and there will not any visible effect on the display (blank display) and remains blank until "Power On Sequence" powers it up.

Preliminary

8.17 Power Level Definition

8.17.1 Power Level

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

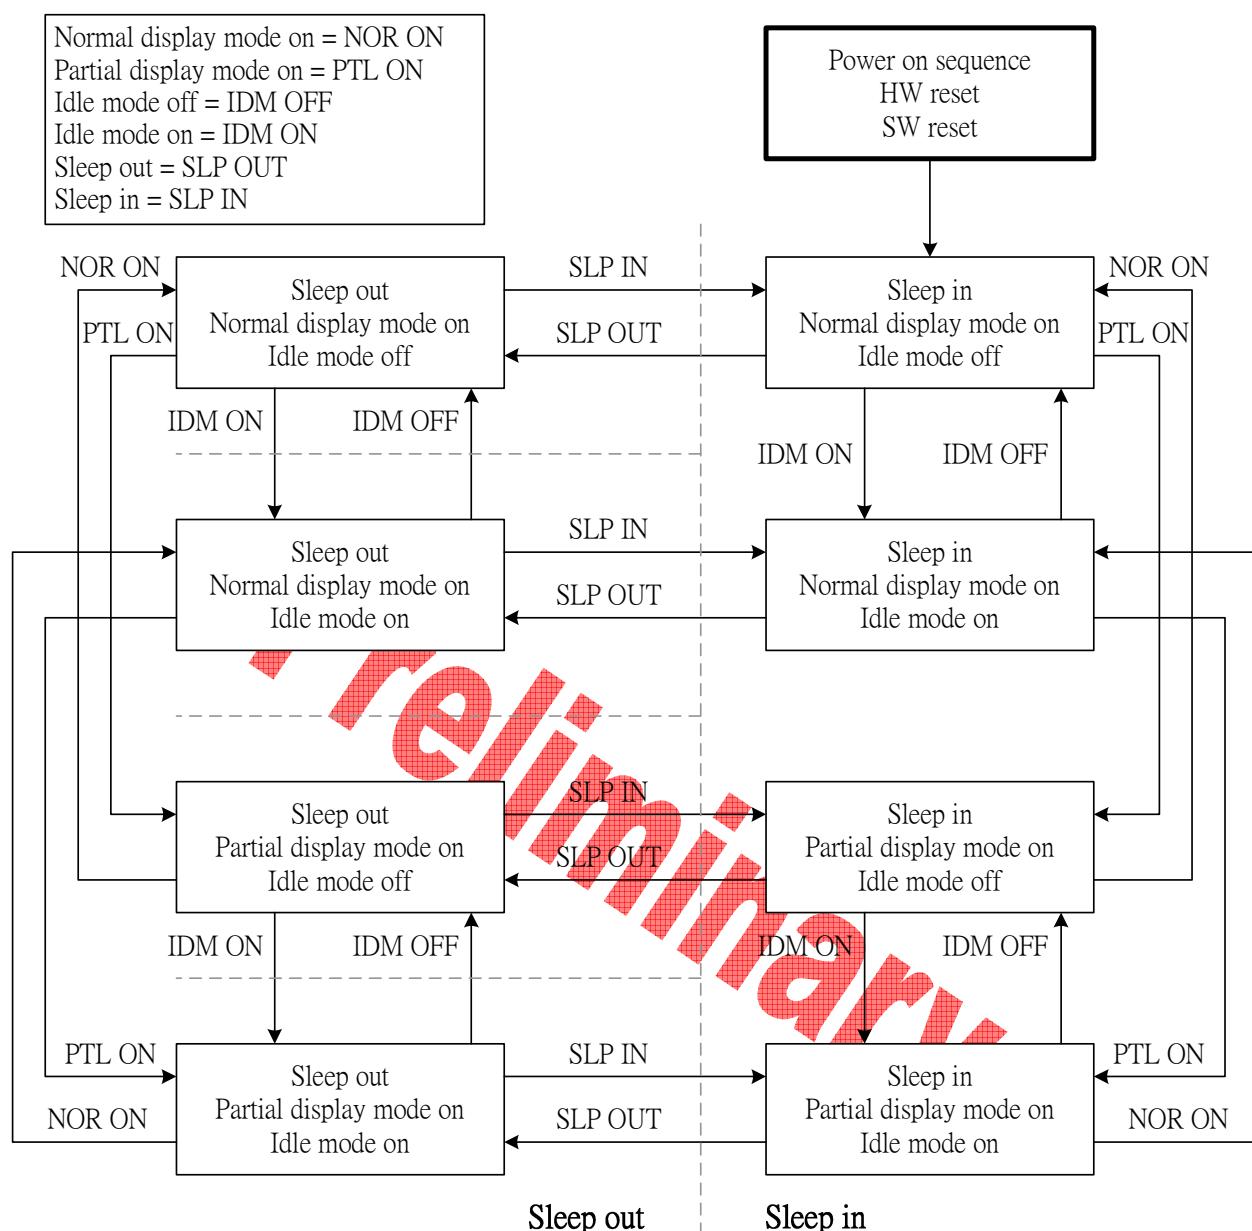

In this mode, part of the display is used but with 8 colors.

5. Sleep In Mode

In this mode, the DC: DC converter, internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

Note: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

8.19 Gamma Correction

ST7789V incorporate the gamma correction function to display 262,244 colors for the LCD panel. The gamma correction is performed with 3 groups of registers, which are gradient adjustment, contrast adjustment and fine- adjustment registers for positive and negative polarities, and RGB can be adjusted individually.

Preliminary

8.20 Gray voltage generator for digital gamma correction

ST7789V digital gamma function can implement the RGB gamma correction independently. ST7789V utilizes look-up table of digital gamma to change ram data, and then display the changed data from source driver. The following diagram shows the data flow of digital gamma.

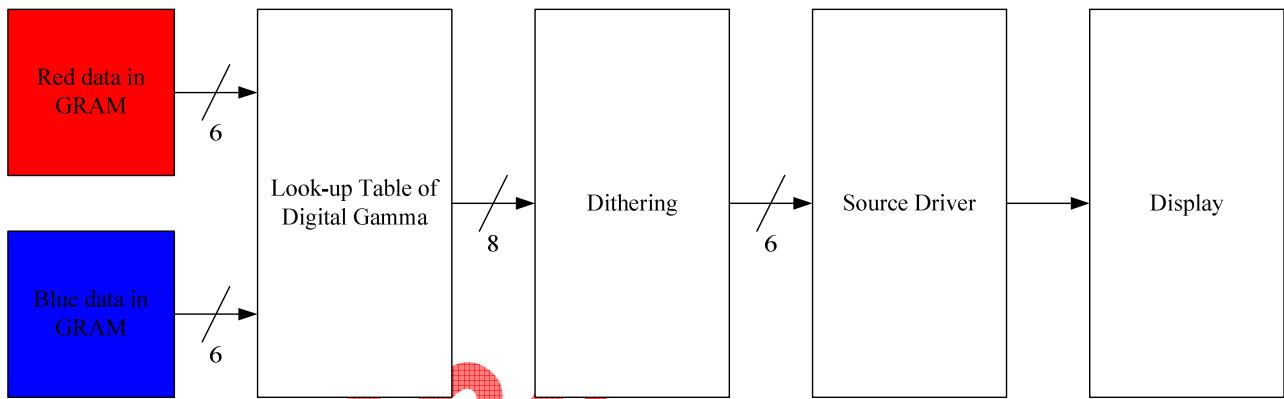

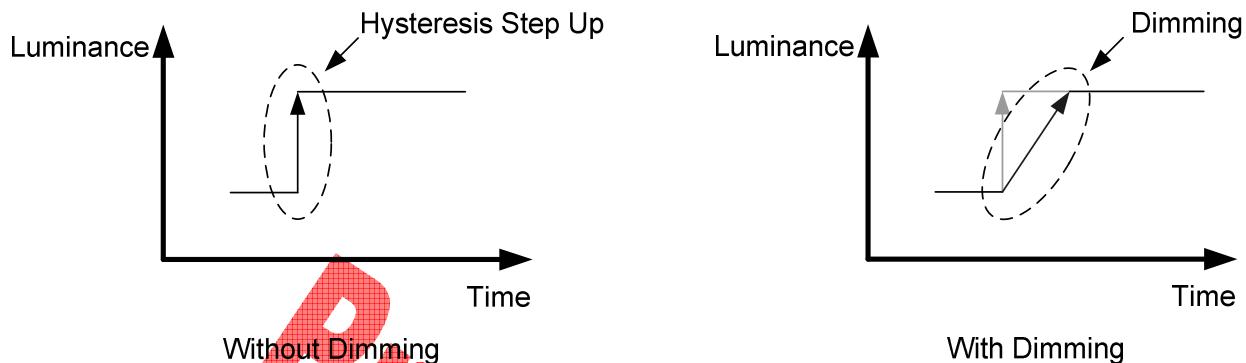

Figure 37 Block diagram of digital gamma

There are 2 registers and each register has 64 bytes to set R, G, B gamma independently. When bit DGMEN be set to 1, R and B gamma will be mapped via look-up table of digital gamma to gray level voltage.

8.21 Display Dimming

8.21.1 General Description

A dimming function (how fast to change the brightness from old to new level and what are brightness levels during the change) is used when changing from one brightness level to another. This dimming function curve is the same in increment and decrement. The basic idea is described below.

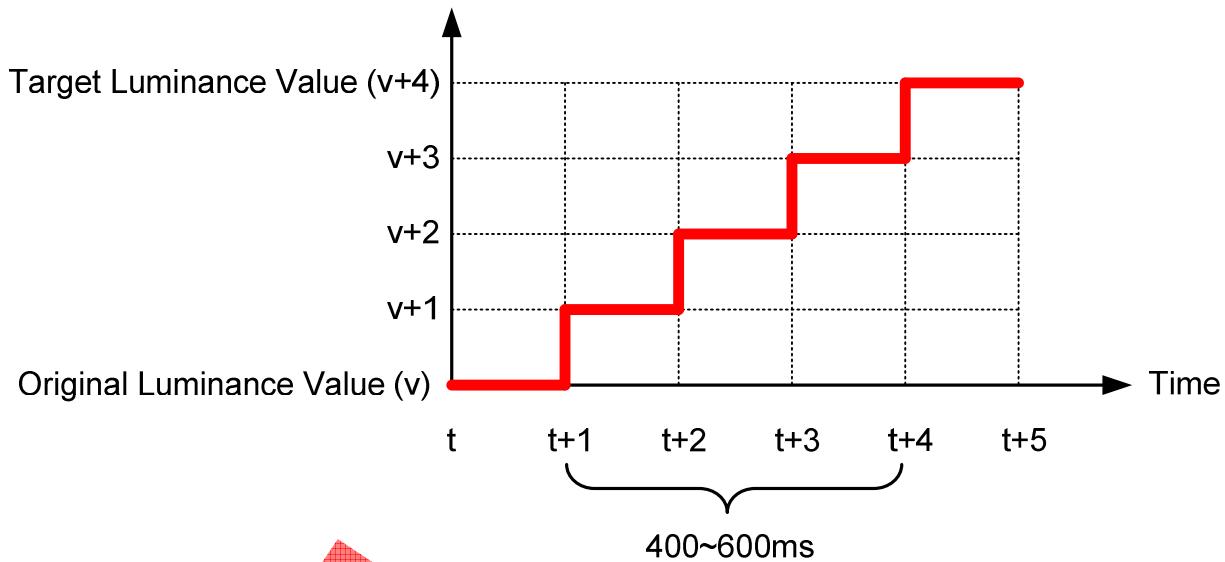

Dimming function can be enable and disable. See "Write CTRL Display (53h)" (bit DD) for more information.

8.21.2 Dimming Requirement

Dimming function in the display module should be implemented so that 400-600ms is used for the transition between the original brightness value and the target brightness value. The transferring time steps between these two brightness values are equal making the transition linear.

The dimming function is working similarly in both upward and downward directions.

An upward example is illustrate below

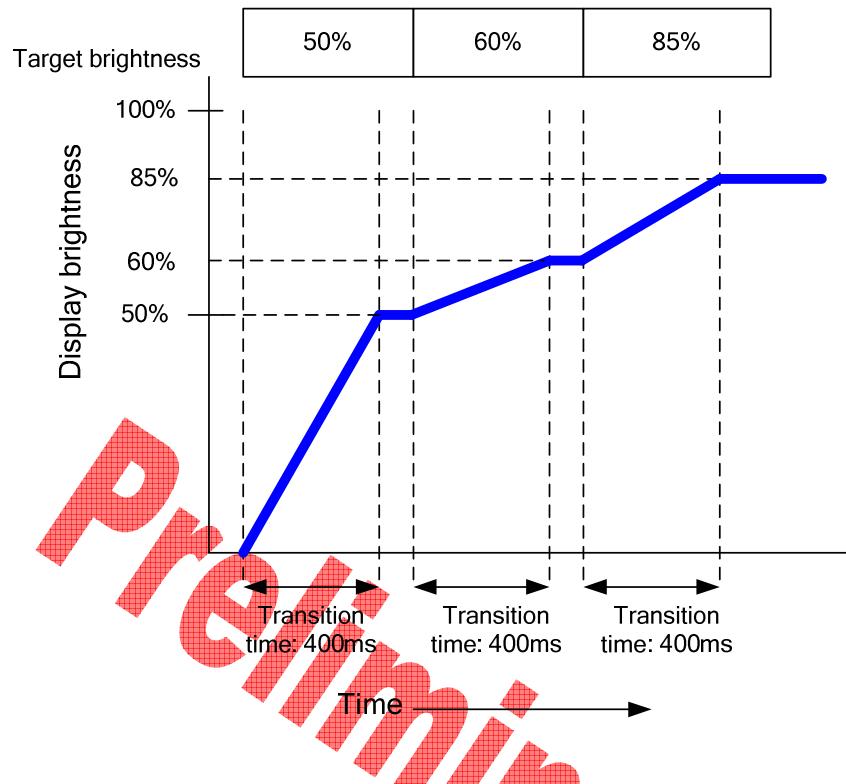

Preliminary

8.21.3 Definition of brightness transition time

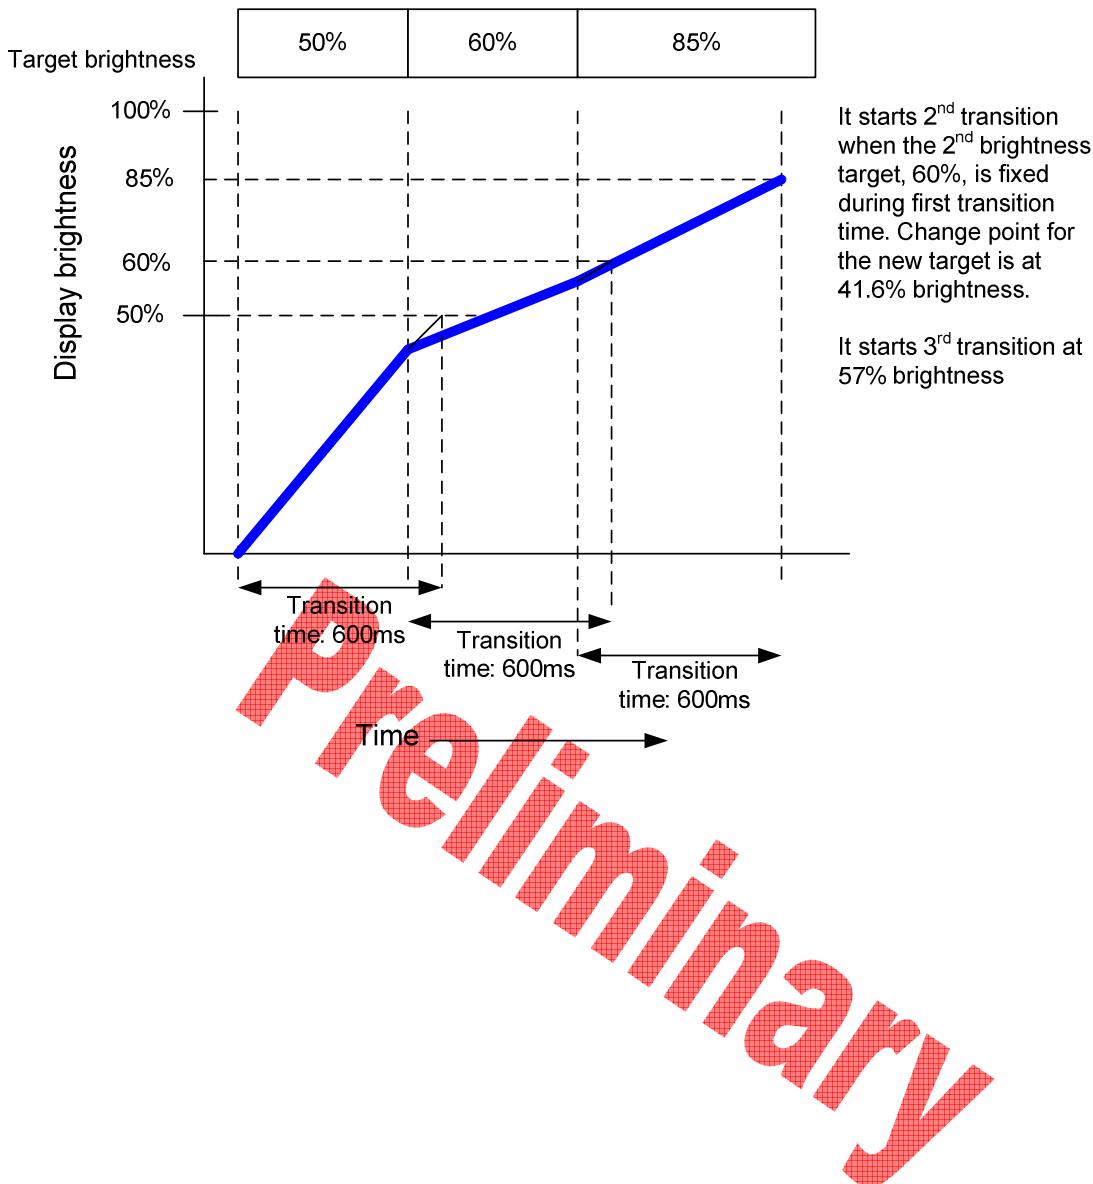

- Shorter transition time than 500ms.

There is some stable time between transitions. Below drawing is for transition time: 400ms.

- Longer transition time than 500ms

There is no any stable time between transitions. Below drawing is for transition time: 600ms.

8.22 Content Adaptive Brightness Control (CABC)

8.22.1 Definition of CABC

A Content Adaptive Brightness Control function can be used to reduce the power consumption of the luminance source. Content adaptation means that content gray level scale can be increased while simultaneously lowering brightness of the backlight to achieve same perceived brightness. The adjusted gray level scale and thus the power consumption reduction

Definition of Modes and target power reduction ratio:

- Off mode: Content Adaptive Brightness Control functionality is totally off.
- UI [User interface] image mode: Optimized for UI image. It is kept image quality as much as possible. Target power consumption reduction ratio: 10% or less.
- Still picture mode: Optimized for still picture. Some image quality degradation would be acceptable. Target power consumption reduction ratio: more than 30%.
- Moving image mode: Optimized for moving image. It is focused on the biggest power reduction with image quality degradation. Target power consumption reduction ratio: more than 30%.

Note 1: Updating partial area of the image data should be supported by CABC functionality.

Note 2: Processing power consumption of CABC should be minimized.

Preliminary

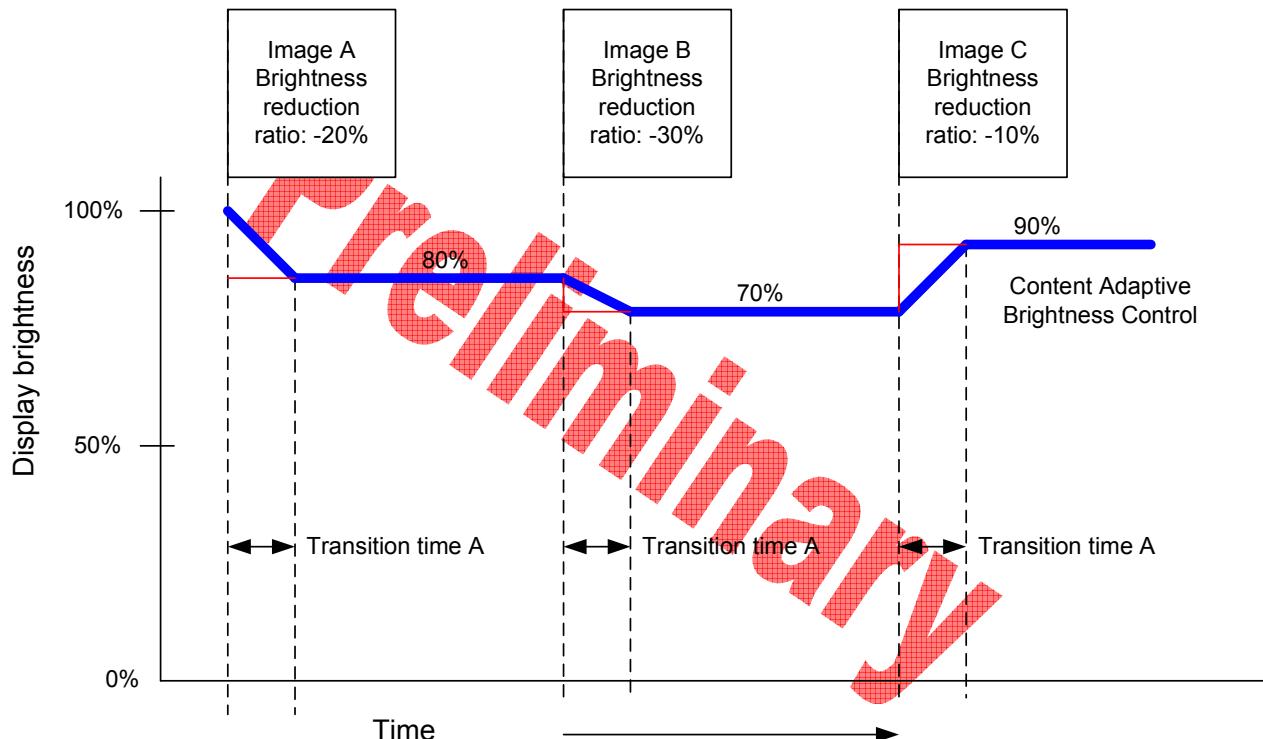

The transition time for dimming function is illustrated below.

- Content Adaptive Brightness Control

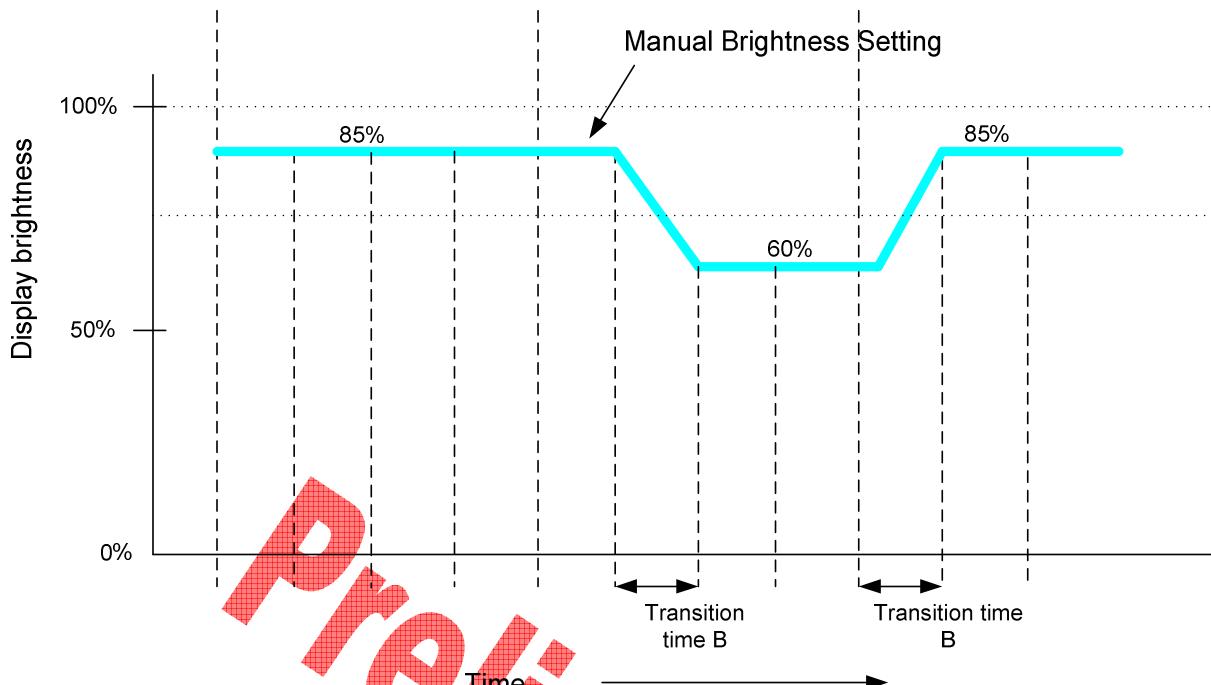

Display brightness is changed, according to the image contents. The following graph mentions the case of displaying three different images.

- Image A: -20% brightness reduction
- Image B: -30% brightness reduction
- Image C: -10% brightness reduction

Transition time from the previous image to the current displayed image is “transition time A”.

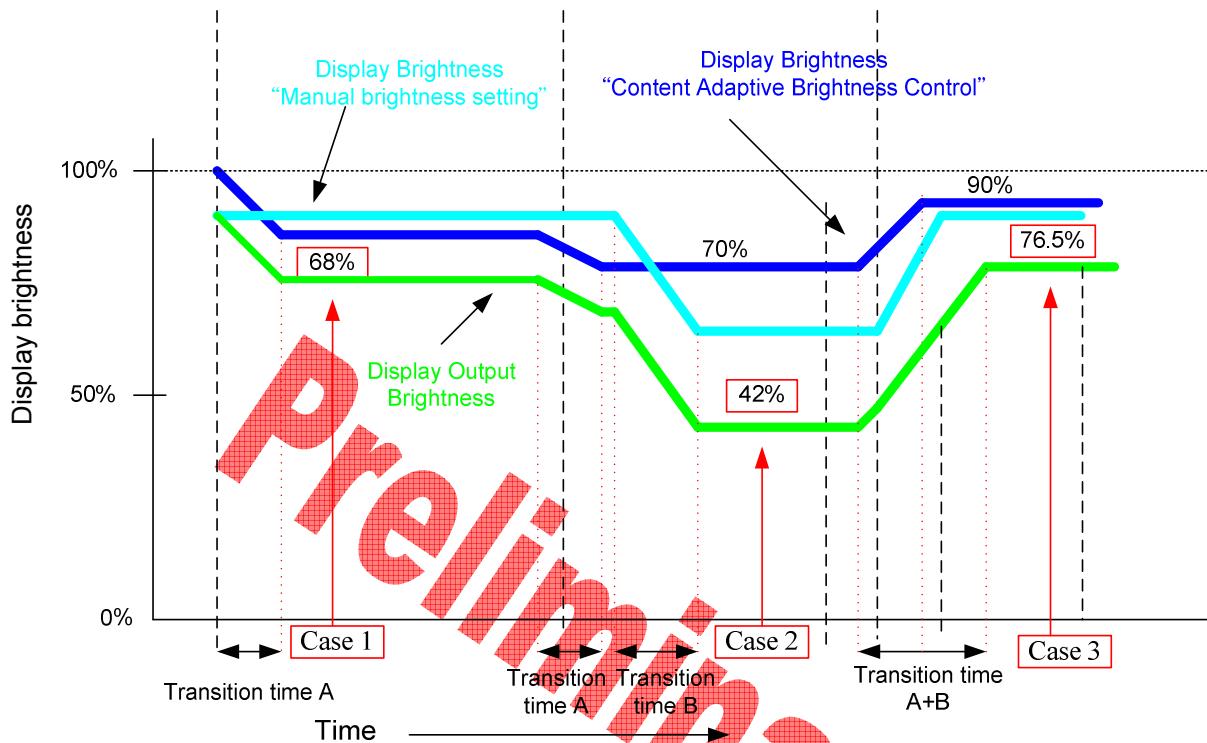

- Manual brightness setting and Dimming function

- Combine Display brightness

Green line in the following graph is for the output brightness of display. It is combined with both display brightness, which are defined in the above graphs.

Maximum transition time is transition time A+B.

Brightness level calculates with the following formula.

$$\text{Display Output brightness} = \text{Manual Brightness setting} * \text{CABC brightness ratio}$$

| | Manual Brightness setting | Brightness ratio [CABC] | Display Output brightness |
|--------|---------------------------|-------------------------|---------------------------|
| Case 1 | 85% | 80% | 68% |
| Case 2 | 60% | 70% | 42% |
| Case 3 | 85% | 90% | 76.5% |

Transition time from the current brightness to target brightness is A+B in the worst case.

8.22.2 Minimum brightness setting of CABC function

CABC function is automatically reduced backlight brightness based on image contents. In the case of the combination with the LABC or manual brightness setting, display brightness is too dark. It must affect to image quality degradation. CABC minimum brightness setting is to avoid too much brightness reduction. When CABC is active, CABC can not reduce the display brightness to less than CABC minimum brightness setting. If CABC algorithm works without any abnormal visual effect, image processing function can operate even when the brightness can not be changed.

This function does not affect to the other function, manual brightness setting. Manual brightness can be set the display brightness to less than CABC minimum brightness. Smooth transition and dimming function can be worked as normal.

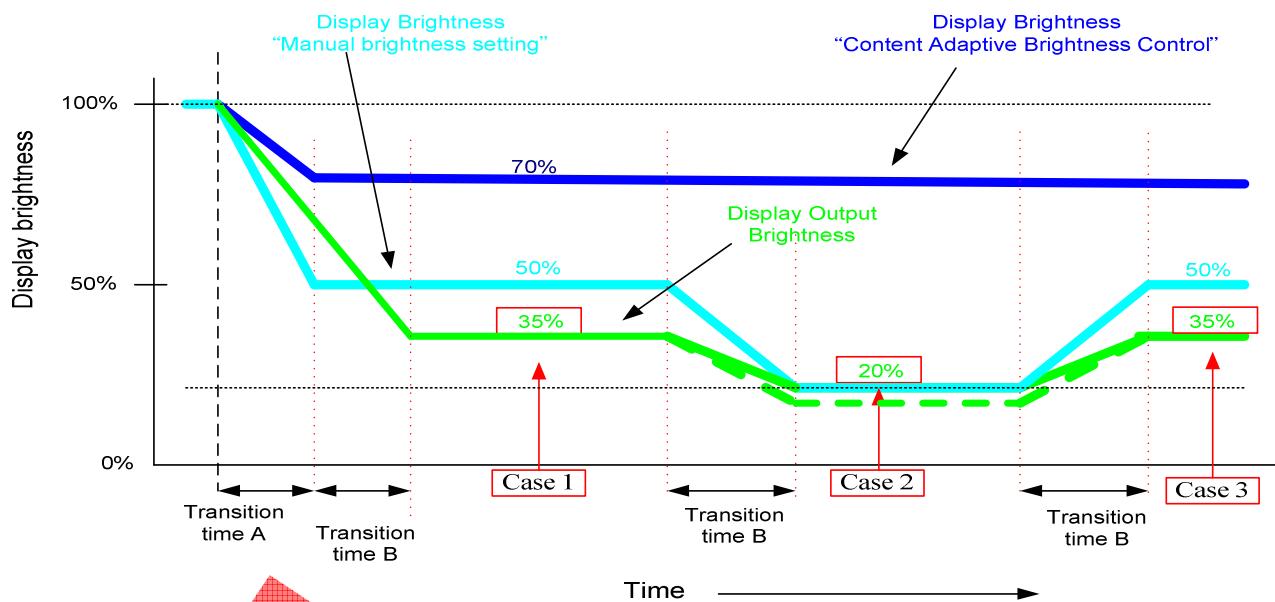

When display brightness is turned off (BCTRL=0 of "9.1.39 Write CTRL Display (53h)", CABC minimum brightness setting is ignored. "9.1.44 Read CABC minimum brightness (5Fh)" always read the setting value of "9.1.43 Write CABC minimum brightness (5Eh)".

| | WRCABC (55h) | Function | RDCABCMB (5Fh) | Image |
|----------|--------------|----------|----------------|---------------|
| Sleep-in | | NA | WRCABCMB (5Eh) | |
| CABC off | 00b | Disable | WRCABCMB (5Eh) | Original |
| CABC on | 01b/10b/11b | Enable | WRCABCMB (5Eh) | CABC modified |

Brightness level calculates with the following formula.

$$\text{Display Output Brightness} = \text{Manual brightness setting} * \text{CABC brightness ratio}$$

Below drawing is for the explanation of the CABC minimum brightness setting.

CABC minimum brightness value = 51 (33h: 20% display brightness)

| | Display Brightness [manual setting] | Brightness ratio [CABC] | Calculation result of the display brightness formula | Display Output Brightness | Image |
|--------|--|----------------------------|--|------------------------------|---------------|
| Case 1 | 50% | 70% | 35% | 35% | CABC modified |
| Case 2 | 20% | 70% | 14% | 20% | CABC modified |
| Case 3 | 50% | 70% | 35% | 35% | CABC modified |

At the case 2, the calculation result of the display brightness is 14%. CABC minimum brightness value is set to 20% brightness. Actual display brightness is 20% as the CABC minimum brightness setting.

| Description | <p>-This command is used together with Vertical Scrolling Definition (33h).</p> <p>-These two commands describe the scrolling area and the scrolling mode.</p> <p>-The Vertical Scrolling Start Address command has one parameter which describes which line in the Frame Memory will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below:</p> <p>When ML=0</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, vertical Scrolling Area = 320 and VSP = '3'</p> <p>When ML=1</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, vertical Scrolling Area = 320 and VSP = '3'</p> <p>NOTE: When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect.</p> <p>VSP refers to the Frame Memory line Pointer</p> | | | | | | | | | | | | |
| Restriction | Since the value of the vertical scrolling start address is absolute (with reference to the frame memory), it must not enter the fixed area (defined by Vertical Scrolling Definition (33h)- otherwise undesirable image will be displayed on the panel) | | | | | | | | | | | | |

10 APPLICATION

10.1 Configuration of Power Supply Circuit

10.2 Voltage Generation

The following is the ST7789V analog voltage pattern diagram:

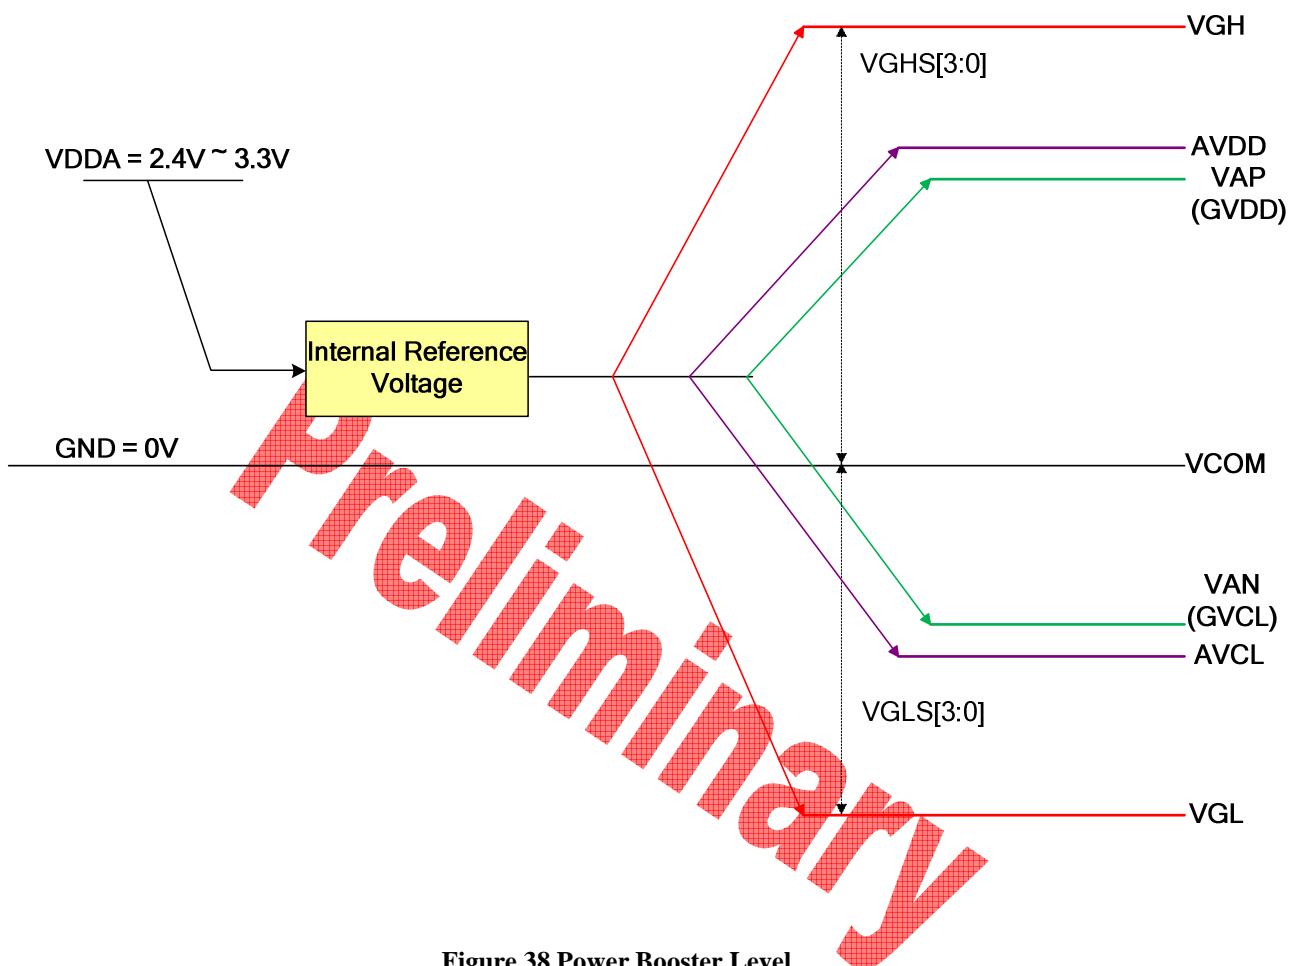

Figure 38 Power Booster Level

10.3 Relationship about source voltage

The relationship about source voltage is shown as below:

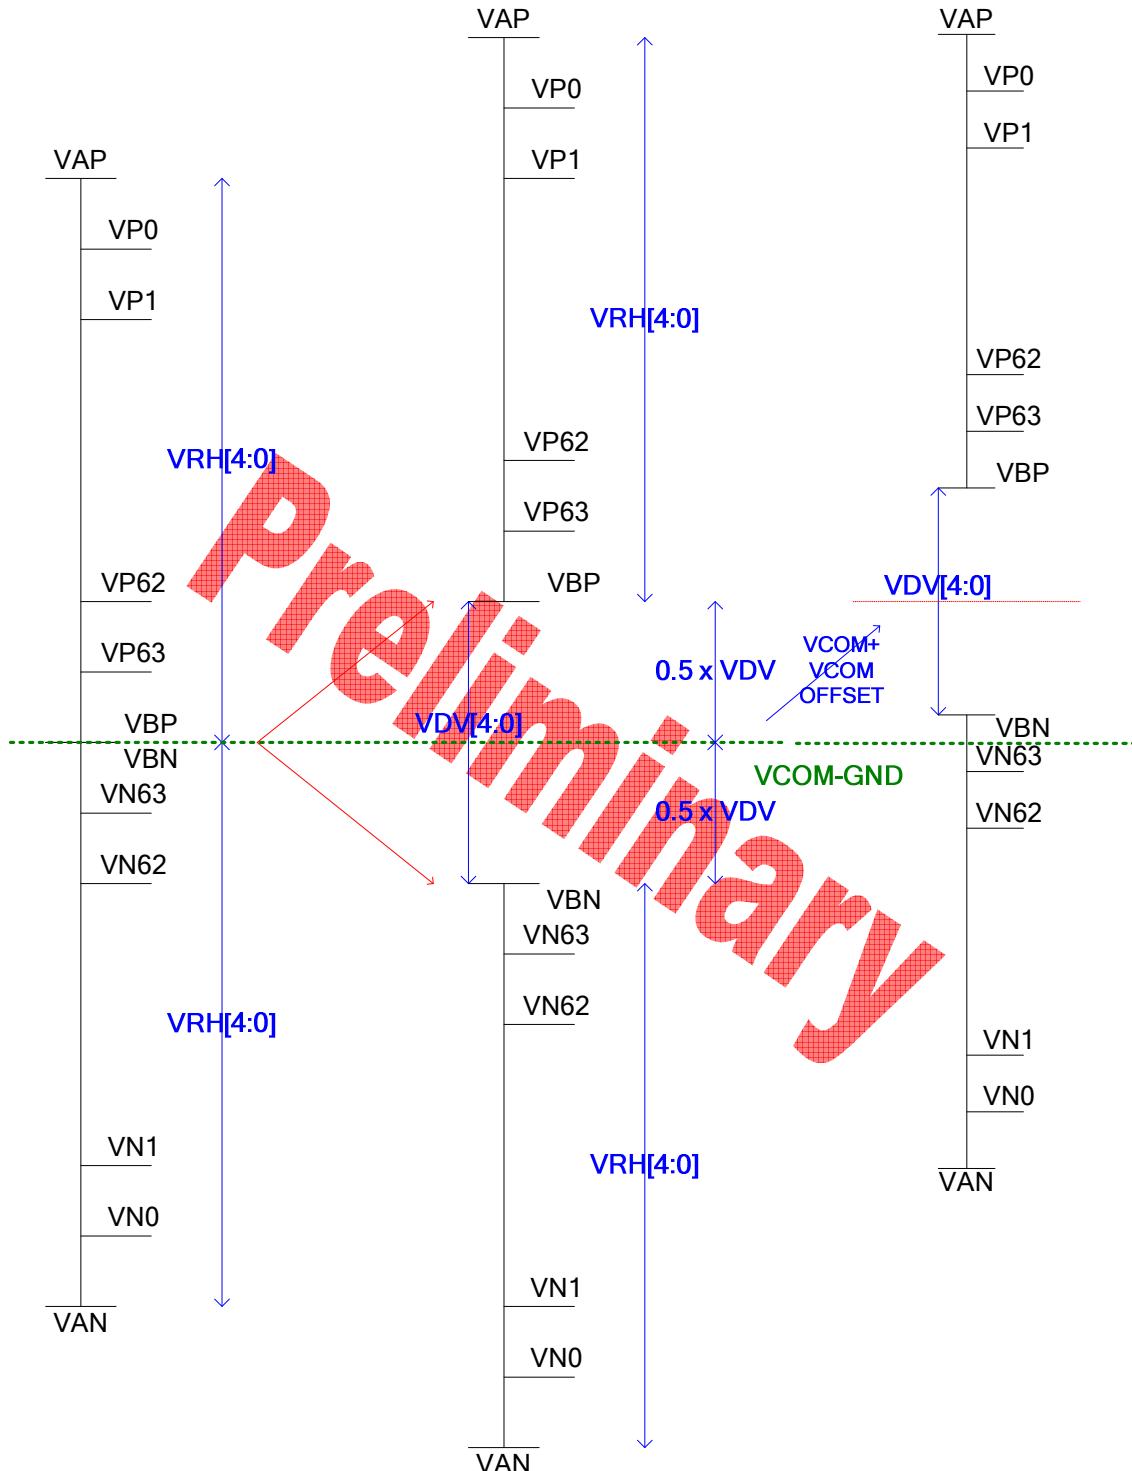

Figure 39 Relationship about source voltage

Note: if $VDV=0V$, $VBP=VBN=VCOM+VCOM OFFSET$.
